The Motor Cycle T.T. Race, 1908.

TO PRIVATE OWNERS.

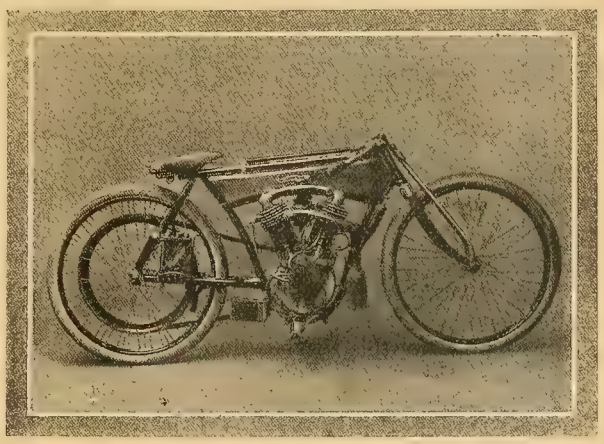
NOW that you are considering the question of your new machine, why not select one suitable for the classic event of the season, and make a bid for the Tourist Trophy? Last year, in spite of a combination of adverse circumstances, the first Motor Cycle T.T. Race proved a great success, and was voted a most interesting experience by everyone who assisted, whether as competitor, official, or spectator. This year's event promises to be contested under vastly more favourable conditions, and should, if adequately supported, afford a sporting experience at once unique, instructive, and amusing.

Whether you incline to a twin or prefer a single-cylinder, you are welcome. In either class there is "plenty to go for"—quite a variety of prizes, mostly of a value in keeping with the importance of the event. The cylinder dimension limits admit standard engines of practically every maker of repute, and the nature of the course renders a specially light machine not only inadvisable, but, in my opinion, a needless risk of one's chances of success.

"Oh, but," says the Private Owner, "when it comes to long-distance racing, I've no chance against the professionals; it's simply risking my neck for nothing. Besides, it's such a fag to get the machine across the water."

Your pardon, good sir. The former view is, in my opinion, quite a mistaken one. With regard to the latter item, permit me to assure you that the trouble is very small indeed.

In the case of last year's race, the petrol allowance rule had the intended effect of limiting the speed, the winner's average being the very reasonable one of thirty-eight miles per hour. This I consider a perfectly safe speed, having regard to the nature of the course, and the fact that the roads forming the latter are during the progress of the event closed to the public. This year the petrol allowance has been still further reduced, so that it is fairly safe to assume that last year's speeds will not be substantially exceeded. Consequently there will be neither need nor opportunity for either professional or amateur to take any undue risks. It is well known that the men



The neat-looking Leader racer fitted with 7 h.p. Peugeot engine, ridden by L. Kickham in both the Brooklands motor cycle races. In the first race Mr. Kickham finished second, but on the 9th inst. he was unable to catch up the limit men. The engine is fitted with a special current distributer.

who in the 1907 event cut the corners closely and otherwise took risks did not win.

The course is—as it should be—of a nature to require the exercise of a fair degree of driving skill and care. I should not, however, class it as extraordinarily difficult, nor as at all beyond the capabilities of any motor cyclist with fair experience of touring at good average speed, and possessed of the *mens sana in corpore sano* essential to success in all forms of athletic competitions. The knowledge that the course is as scrupulously reserved for his use as would be the case at, say, Brooklands or Canning Town, has naturally a "grateful and comforting" effect on the inexperienced competitor, giving him encouragement to extract the best pace from his mount, and confidence in approaching corners at speeds that would be quite unjustifiable under normal conditions.

So far, therefore, as the course is concerned, the professional cannot be said to have any undue advantage.

Genuine Touring Machines must be Ridden.

When we come to the question of the machines to be used, we find that the regulations are clearly in favour of the private owner. No machine will, I understand, be allowed to start which is not obviously and incontestably a genuine touring motor bicycle, lacking only pedal gear to bring it up to the most complete standard specification. Inaccessible valves, cylinder ports, inefficient silencers, gingerbread fittings of any kind—all are strictly barred. Since undue lightness in frame, engine, or tyres, implies almost certain failure, it is obvious that the mechanical advantages attainable by the trade rider, as against a well-tested and efficient privately-owned machine, are practically nil.

The fuel for use in the race is, as is well-known, supplied by the A.C.U. None other may be used, nor is any addition thereto possible. By a very reasonable arrangement, entrants can obtain from certain local dealers supplies of this special Club fuel for practising purposes, so that "tuning up" may be carried out by all competitors, under conditions identical with those obtaining in the race. I may say that last year I found this special fuel thoroughly satisfactory in every respect. Obviously, then, there is no chance for any advantage to be "worked in" here, whether by trade rider or private owner.

With regard to the arrangements for, and conduct of, the actual race, I willingly testify that nothing could be fairer, more impartial, or more generally creditable than the attitude of the officials. Keen upon making the event a perfect success, and willing to sacrifice all consideration for personal comfort and interest in order to secure that end for which they had come so far, this little band of disinterested enthusiasts discharged its multifarious duties in a remarkably efficient manner. Many of them were professors of science, consulting engineers, journalists, and the like, whose names are well-known in the motor world, and who cheerfully gave unstinted service, not only of highly trained intellect, but of willing and capable hands. Any suggestion of partisanship would have been deemed absurd—even by an aggrieved competitor, had one existed. A picture rises before me of a private competitor, stretching his legs during the brief luncheon interval, with a sandwich in one hand and a glass of lemonade in the other, watching his tank undergoing replenishment at the hands of a well-known journalist, the spattered crock being carefully supported by a professor of engineering and an official of the R.A.C.

In short, everything possible is done to promote the comfort and safety, and to equalise the chances of all competitors. The ideal of the A.C.U. and its officials is, unquestionably, to render the T.T. Race an impartial test of ability on the part of the driver, and of reliability, economy, and utility in the case of the machine.

Some of the early arrivals for the Liverpool M.C. Hill-climbing Competition on the 16th inst.

So much for the imaginary advantages of the trade rider. Now as to other matters, beginning with the journey thither.

The Journey and Other Arrangements.

The preliminary stage (to Liverpool or Fleetwood) is, of course, covered either by rail or by road at the convenience of the competitor. Once arrived upon the landing stage, the motor cyclist discovers two agreeable facts: first, that the carriage of his machine is to cost him considerably less than would be charged for a similar distance over any British line of railway, and (2) that he has a great "pull" over the car owner, inasmuch as he is permitted to take his motor cycle with him on the passenger boats. There is plenty of assistance forthcoming to get the machine on board, where, lashed to the rail which runs round the engine room, it securely performs the journey under cover, and

The Motor Cycle T.T. Race, 1908.—

can, if the owner is unnecesarily nervous on its account, be kept under observation during the whole journey.

After a sea passage offering an enjoyable change, and terminated before monotony sets in, one is set ashore in a new land—a country where the motorist of any degree is welcomed without being fleeced; where "rules and regulations," other than the requirements of common courtesy and consideration, are practically non-existent; where red tape is at a discount, and police traps as scarce as dentition in fowls. The motor cyclist visits a quiet little office, where courteous officials promptly present him with the untrammelled freedom of the Manx highways—and decline to accept any payment therefor! Comfortable accommodation at really reasonable rates will be as plentiful this year as last, the race being fixed to take place towards the end of September, when the great rush of visitors will be over.

Last year most of the competitors stayed in Douglas, where facilities for evening recreation are abundant. A few quieter tastes "pitched their moving tents" at Peel or Kirk Michael, which have the advantage of being on the course. The nearest point of the latter to Douglas is at Ballacraine, where the course leaves the Peel-Douglas Road and turns northwards towards Kirk Michael. Ballacraine is not far from Hall Caine's picturesque home, and is about eight miles from the capital.

Practice Spins.

Directly the competitor has secured quarters to his liking his thoughts will naturally turn to the question of practice. In this respect, again, competitors in the 1907 motor cycle event had enviable advantages over the car drivers. The latter were only allowed to practise between daybreak and 7 a.m., and were required to be "off the map" for the day and cars safely garaged by 8 a.m. On the stroke of the latter hour the single-track speed merchants were free to commence their trial spins. No "closing time" was imposed, the only requirements being that discretion should be exercised, so as to avoid any risk of offence or damage to the property or persons of the islanders or visitors. The results of this experiment were, I believe, perfectly satisfactory on both sides, and it is to be hoped that a similar arrangement will be again adopted this year. To say that the Manx entered into the spirit of the thing is to fail to do them justice. Children and poultry were kept off the road, horses promptly drawn aside, corners indicated by volunteer signallers—everything done that could be reasonably expected, in order that the entrants might be able to achieve good average circuit times. As a matter of fact, some of the competitors never equalled in the race itself their best lap times made in practice, owing to their retaining gears too high for use against the strong, cold wind that sprang up early on the morning of the race.

To the lover of speed those practice spins are, in the words of a well-known advertisement, "a luxury unknown in England." There are stretches of road where the pace attainable is only limited by the maximum engine speed. Such sections of highway would certainly be police trapped in many English counties, and yet in the Island, secure from persecution beneath the ægis of a more enlightened administration, the motor cyclist daily performed at over fifty miles per hour, and nothing happened. Why should it?

Confidence v. Police Traps.

Confident in the knowledge of competent efficiency on his own part, and rapidly operating control as regards the machine, the rider keeps a keen look-out, and, driving always with due discretion, amply justifies the official confidence, which willingly accepts his parole in preference to encouraging falsehood amongst public servants.

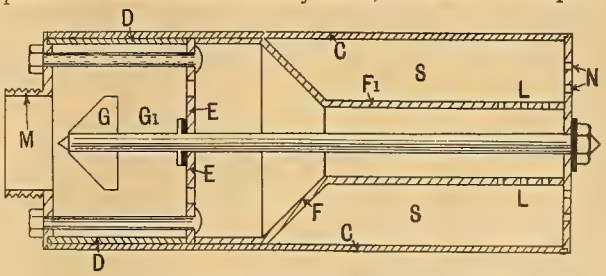
To those not greatly interested in racing "The Island" offers a touring ground second to none as regards beauty and variety of scenery, always within easy reach of first-class accommodation. I trust, therefore, that I may succeed in inducing a good number of motor cyclists to visit "little Man" this year, and so, by no further effort than that involved in the enjoyment of a comparatively cheap holiday, assist in the support of two good causes—the encouragement of the Manx authorities in an enlightened policy, and the promotion of the success of the Motor Cycle Tourist Trophy Race, 1908.

R. W. AYTON.

AN EFFECTIVE SILENCER.

WITH a view to rendering the noise of the exhaust less audible, Mr. B. F. R. Collyer, of Northampton, has designed an exhaust box for motor cycles of which the annexed illustration is a sectional elevation. The burnt gases enter through the end plate M, and strike the slanting surface of the cone G, afterwards expanding in the surrounding chamber G_1. From this chamber they pass through holes in the plate E and strike the slanting surface of the larger cone F of the inner cylinder F_1, rebound, expand, and pass down F_1, escape through holes L L into the chamber S S, where the gases finally emerge through holes N in the end plate.

The inventor recommends that the end plates M and N and the inner cylinder F and cone G be made of brass, the outer cylinder C and inner cylinder D of iron tubing. Some time back Mr. Collyer sent us a silencer for trial which we fitted on one of our machines. We found it silenced the exhaust effectively, but at high speeds with full throttle there was a slight tendency towards back pressure. We understand that a later pattern is free from this objection, and as our experiment was made after lengthy use of a silencer cut-out, it is only to be expected that some slight loss of power would be apparent. There is no reason why this particular silencer should not also be provided with a cut-out for use in open country free from traffic.



HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 396*)

TRAILERS.

220. A trailer is an unsatisfactory method of conveying a passenger, and under no circumstances should any trailer not specially built for motor work by a reliable firm be attached to a motor bicycle. I have twice had breakages with special motor trailers, and in addition they are easily upset, and the driver may pardonably forget how much room he needs when seeking a fissure in the traffic.

They are very shaky, and the passenger gets the full benefit of all dust, noise, and smell.

It is prudent for the driver to shout once in every mile, "Are you there?"

TUNING UP.

221. One point requires to be kept in mind in all efforts to get the best out of any motor cycle engine, viz., that the power of any motor cycle engine depends primarily upon its *speed of revolution*. From beginning to end, therefore, study methods of increasing engine speed. In connection with this, two warnings—

1. Speed when running light on the stand or free engine is not necessarily reproduced under load on the road. The engine explosions must blend into a continuous indistinguishable purr or roar *on the road*.

2. With twin-cylinder engines, aim at getting the highest possible engine speed out of each cylinder. If one is faster than the other, the other could be accelerated by judicious attention; moreover, it is slowing the faster piston. Therefore, frequently test each cylinder individually by short circuiting its plug with a screwdriver, or holding down its inlet valve.

METHOD.

The Machine.

There are fewer points to verify about the machine, therefore always commence with it.

Is the frame true, and wheels accurately in track? All bearings properly adjusted and lubricated? No rubbing of any brake in off position?

The Transmission.

If by belt, is pulley clean and unworn, and is belt clear of bottom of groove? Is rear belt rim true and clean, and deep enough for belt to be flush with its top edges, while clearing the bottom of the groove? Is belt clean, well-dressed (if leather), and pliable, and loose enough to give 2in. of vertical movement when firmly pressed on either of its long runs?

If by chain, are chains clean, lubricated, and unworn? Are the countershaft bearings adjusted and oiled?

If by gear, are gear shafts free in bearings, teeth properly meshed, and gearbox filled with grease or thick oil?

The Engine.

In engine there are two main points to watch—compression and valve action.

COMPRESSION.

Points of leakage: Past piston rings, through valve seatings, past washers surrounding valve caps, compression tap and sparking plug, through joint of cylinder head, if cylinder be not cast in one piece.

PISTON RINGS

must be just free in grooves, without noticeable up and down play, and be bright all round. If marked with brown patches, and yet not stuck in grooves, a new ring fitting cylinder more accurately is needed. If gummy in grooves, clean groove and ring with paraffin and brush. If slots are in line, space out to 120°.

VALVE SEATINGS.

Grind in valves as previously described, beginning with 220 emery or coarse carborundum, and finishing with fine carborundum or crocus powder, till whole bevel face of valve and its seating are brightly polished and free from pitted marks.

COMPRESSION WASHERS.

It is commonly supposed that the absence of stains round the compression washers shows that there is no leakage. This is not true. Squirt a few drops of thick engine oil round washers, and force engine over compression. If no bubbles, washers are perfect. Otherwise, replace them. Old washers may sometimes be resuscitated by soaking in oil.

CYLINDER JOINT.

Re-make with brown paper soaked in boiled linseed oil. Be careful new packing is not thicker or thinner than one thick sheet or two thin sheets of brown unglazed packing paper.

VALVE ACTION.

Is timing right?

Is there a big gap between valve stem and head of tappet? Gap is right if when engine is *hot* the tappet just releases a thin sheet of notepaper placed between valve and tappet, when tappet falls. The gap with engine cold varies according to degree of expansion in valve stem when hot.

Average gap, 1-32in.

Is lift sufficient? It will be about a quarter of the effective diameter of valve opening, roughly ¼in. May be reduced by wear anywhere in valve system, by fitting new valve with shorter stem, and by mishap to valve lifting mechanism.

Are valve springs of correct strength and strong temper? A mechanical valve's spring must be set by experiment, since too weak a spring leads to late closing, and too strong a spring throws resistance on the cam, and is very prone to break the heads off the valves. Keep a standard spring, and when tuning engine, test spring in use by pressing it against standard, end to end. An automatic inlet valve is best served by as strong a spring as the engine can open at starting, but slightly weaker inlet valve springs will serve for ordinary touring. Correct opening of automatic inlet valve probably will not exceed 3-32in.

Are valves free in guides when hot? If not, remove valve and clean the stem thoroughly with emery cloth.

(To be continued.)

Liverpool M.C. Hill-climb, May 16th. Mr. and Mrs. Frank Lee half way up the steepest part of the hill.

The A.C.U. Sutton Bank Hill-climb.

Looking down the steepest part of Sutton Bank—gradient 1 in 3·96. Lake Gormire in the distance.

Near the top part of the hill where the gradient is slightly easier. Only the best hill-climbers will reach this point.

IN our issue of May 13th, on pages 377-8, we published a contour section and plan showing the location of the famous Sutton Bank, near Thirsk, which has been selected as the venue for the A.C.U. open hill-climb on Saturday next. If readers will compare the section and plan with the illustration on this page, they will gain an idea of the severity of the gradients. Sutton Bank is one of the roads over the Hambleton Hills, and is on the route *viâ* Helmsley and Pickering to Scarborough. It can be avoided, however (and is avoided!), by ordinary tourists. The bank is said to be the steepest ascent on any main road in England, the length being about one mile and the average gradient one in eight.

Entries for Saturday's competition, which commences at 2 p.m., will be found on our late news pages.

Panoramic view of Sutton Bank on the Hambleton Hills, the scene of the A.C.U. Open Hill-climb for motor cycles next Saturday.

THE TOUR DE FRANCE.

MOTOR CYCLE AND VOITURETTE RELIABILITY TRIALS.

(From our Paris Correspondent.)

THE conclusion of the trials at Paris on Sunday, the 17th inst., was the occasion of a big reception of the survivors by a host of friends and spectators. The survivors, as reported in last week's issue, were:

Class I.—No. 3 (Lurquin-Coudert), No. 4 (Peugeot), and No. 7 (Peugeot).

Class II.—No. 12 (Griffon) and No. 13 (Werner).

Class III.—No. 19 (Bérujeau tricar).

The last day's run was from Tours, and a commencement was made at 5.30 a.m. The road taken was through Chateau-Renault, Vendome, Chateaudun, Bonneval, Chartres, and Rambouillet, the finish being at the Porte-Maillot, Paris. The machines were not due in the control at the Porte Maillot until 1.30 p.m., but all the survivors were in long before this time, and had to wait to be registered. The roads were in a very fine condition, but, owing to the dry weather experienced on the last day or two of the trials, they were inclined to be dusty. However, excellent runs were made by those who were eligible to start on the last day's journey, only one, the Quentin (No. 1), having dropped out from the previous day's run.

The Awards.

Class I.—Quarter-litre (250 cubic centimetres) capacity:

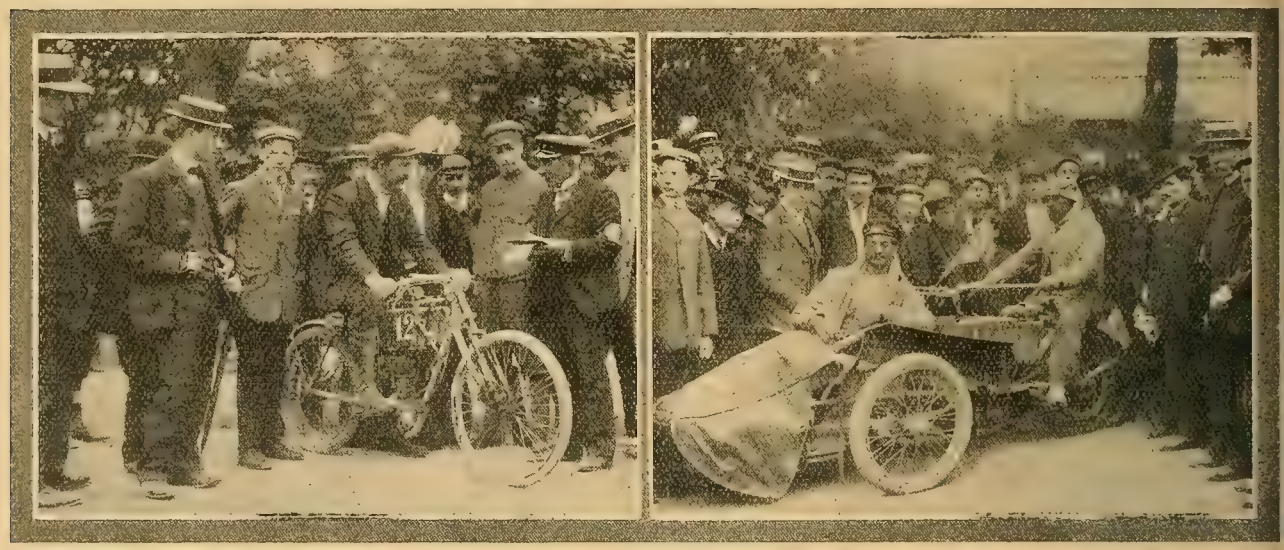
1. Peugeot (Pons), lost no marks.
2. Peugeot (Pean), lost no marks.
3. Lurquin-Coudert (Vilbois), lost 76 marks.
4. Quentin (Mauger), lost 302 marks.

Class II.—Lightweights (210 cubic centimetres capacity):

1. Griffon (Bucquet), lost no marks.
2. Werner (Maillard), lost no marks.

Class III.—Tricars, half-litre (500 cubic centimetres) capacity:

1. Bérujeau (Bérujeau), lost no marks.
2. Furan (Justal), lost 720 marks.



Bucquet (Griffon Lightweight) and Berujeau (Berujeau Tricar), two of the competitors who completed the long trial to schedule time and without the loss of a single mark. We published a photograph of Pons and his Peugeot last week (see page 403).

The small Peugeots have done excellently. The engines measure 64 mm. by 68 mm., and the machines are fitted with Truffault spring forks. Neither the Griffon nor the Werner lightweights lost any marks, but the Griffon is placed first in its class because Bucquet climbed the hill La Baraque, near Limoges, faster than Maillard. The Werner measures 60 by 70 mm., and is said to weigh unladen only about 64 lbs.

PRIZES IN THE END-TO-END RUN.

GOLD medals will be awarded to the entrant of the machine obtaining ninety per cent. of the total marks, and silver medals to those obtaining seventy per cent. of the total marks, together with a certificate of the performance.

In addition, a special gold medal, presented by the proprietors of *The Motor Cycle*, will be awarded to the private owner making the best performance on a motor bicycle, and one for the best performance on a passenger motor cycle.

A special prize will be awarded to the trade rider who adheres to the daily schedule and accomplishes the best performance throughout the trial.

A special prize, presented by Mr. W. H. Wells, will be presented to the private owner making the best performance on a twin-cylinder motor bicycle.

A special prize will be presented by Mr. A. J. Wilson to the rider accomplishing the best performance on a lightweight motor bicycle.

A special prize will be presented by Mr. A. G. Reynolds for the best performance of a machine up Berriedale. Speed not to be taken into account.

A bronze medal will also be awarded to each rider who finishes at John-o'-Groat's within six days, and who does not receive any other award, together with a certificate of the performance.

OCCASIONAL COMMENTS.

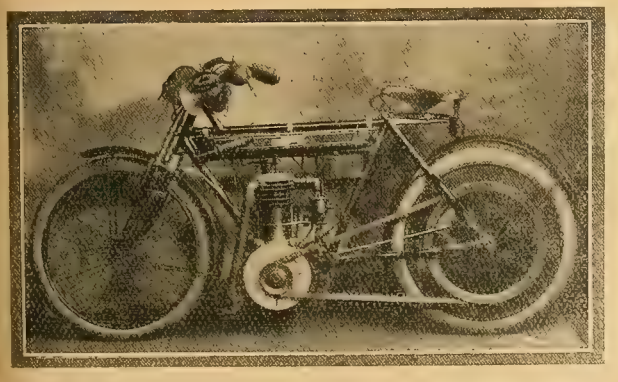
By "IXION."

The Importance of Details.

Two or three of us were talking over End-to-end prospects the other evening, and chipping a member of our party because, having failed to get a guarantee that a machine of famous make would be delivered in June, he had ordered an admittedly inferior machine, of which he could get almost instant delivery, and intended to put it through to John-o'-Groat's instead of the other. He defended himself as follows: "If there is a machine on the market without a single imperfect detail, it's the first year it's ever been so, and you fellows don't know what a fearful nuisance a single faulty detail can be. In the 1906 End-to-end I had a splendid machine, but the stand fitted was on the rear spindle ends. So I said to myself, if my back wheel has to come out I shall take no end of a time over the job! So I fitted a different stand, clamped to the chain stays. That stand robbed the run of all pleasure for me. Its blessed legs splayed, the clips dropped to pieces and so forth in the first forty miles, and for the other 850 miles I could not test my engine on the stand, and whenever I stopped for any purpose I had to find a bit of rock or something to prop the old jigger up with. So this year you can bet every item I start with is going to have a two months' jolly good gruelling on the road. I'd rather start on a second-rater, fitted with a few home improvements, and well studied in a thousand miles' preliminary riding, than use a first-rater uncrated a few days before."

Overheating and Oil.

We have heard great things about overheating in *The Motor Cycle* lately, and more particularly from Mr. R. W. Ayton, whose article in the issue of April 8th every motor cyclist ought to read, learn, and digest. Mine is the more humble task of enunciating practical tips, and, deserting all fearsome technicalities, let me briefly indicate how I have solved my last three cases of overheating. The trouble in each case appeared gradually, but, having once appeared, was chronic. Maximum speed on the level was greatly reduced, however gingerly the machine was driven, and formidable hills were rendered unclimbable. The usual phenomena were all present—fluffy exhaust, glowing engine, rapid pitting of valves, knocking and clanking in the engine. In each case I oiled the engine very liberally indeed, and drove hard till the overheating was very pronounced indeed. When cool I removed and replaced the cylinder, which is a short job all told with many modern machines, and, as I had suspected, found the piston and cylinder practically bone dry. The next step was to inject several charges of the rubbishy oil, and press on till a garage was reached where a more efficient lubricant was procurable. The theory of it matters very little to most of us so long as we can provide a swift and simple remedy, and I should estimate that about fifty per cent. of the cases we hear of are solely ascribable to bad lubricant marketed by the "get-rich-quick" type of motor supply agent.



The 4½ h.p. Noble, ridden by C. B. Heaton in the Essex M.C. Lippitt's Hill-climb. The Noble Motor Co. point out that if this machine had been entered in Class III. it would have won this class as well as Class II.

An Ideal Carburetter.

Now that the lamp makers have taken the unusual step of consulting the riding public as to what sort of head lamp we want, it would be an excellent thing if the makers of a few other accessories would do the same. For instance, we should all like to be allowed to design our own carburetters—not the misty gaseous factors of the design, but the little practical parts. I will start the ball rolling with the idea that others may expand my ideal. My own ideal carburetter, in addition to extracting twice as much kick out of my engine as any other carburetter has hitherto done, should correspond to the following specification:

1. No small soft screws anywhere about it, either in the form of cleaning plugs, throttle stops, or to secure its lids.
2. One large nut, suited for an adjustable spanner to secure the tops of both chambers—as opposed to a milled nut, or a score of microscopic grubscrews.
3. Jet to unscrew separately without disturbing any other part of carburetting chamber.
4. Jet to screw into a detachable holder, so that I can change jets readily to suit the varying temperatures of winter and summer.
5. Float to be marked "top" on its top, so that I may not take it out, forget which way up to return it, and so spoil adjustment of the level.
6. Needle to be "damped" by a screwed adjustable cap, or other device, preventing flooding by vibration.
7. Point of needle to be of a metal that will not wear within 1,000 miles.
8. Throttle and air to be worked by close fitting pistons or slides, so constructed that no air or gas can pass when not required, and so that when I take them down and remove grit they can be easily replaced.
9. Union of petrol feed to be so constructed that I can
   (a) easily engage nut on thread.
   (b) Put a spanner on it, without fouling feed pipe, or other parts.
10. Funnel to be proof against fracture by incautious tightening of any nuts.
11. Jet to be single, not rose shaped, as a single jet is far less liable to choke.
12. Top of needle to have a knob, or other attachment, or float chamber lid, to be fitted with a push button, rendering it possible to flood at starting without removing gloves.
13. Great range in supply of extra air, so that I need not drill holes in my inlet pipe and fit slides to them.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Troubled with Punctures.

I have had so many punctures I am thinking of using Elastes for filling up inner tubes of motor cycle, and shall be glad if you can give me any opinion on the resilience, etc., of the filling. Can the stopping be taken out after setting if found unsatisfactory? My machine is a 2½ h.p. Ariel.—G.S.M.

We have not up to the present tried Elastes on a motor bicycle, so cannot give an opinion, but understand it is quite satisfactory in car tyres. We do not think that the material can be removed from a tube after it has set.

Cooling the Engine Descending Hills.

You recommend in "Motor Cycles and How to Manage Them" that after mounting a hill and descending a fairly steep one, it is good practice to open the throttle wide and allow the cold gas to enter the cylinder to cool it. Do you mean also to have the exhaust valve raised, as my machine still continues to fire when magneto is retarded to full extent? Should this be so, or should I be able to stop the engine from firing with the magneto lever fully retarded? If so, would you kindly state how I could alter same?—A.H., Leeds.

Naturally, the engine will not stop firing if you retard the spark. It is not intended that it should do so. If you wish to stop the magneto firing you must fit a switch, but the latter is not really necessary, and the engine will cool itself if you keep the exhaust valve raised when descending hills. The tip given in "Motor Cycles and How to Manage Them" infers that the exhaust valve should not be lifted under the circumstances mentioned.

Air Valves to Filler Caps.

In last week's issue I notice your remarks, "All petrol tanks should be fitted with an air valve to the filler cap. The usual hole provided allows petrol to slop over, etc." I shall feel obliged if you will give me the maker's name of the above.—J.G.

An extra air valve is made by inserting a piece of very small brass or copper pipe through the filler cap. This pipe may be brought through the centre of the cap and then bent round in the shape of a U, the top end being soldered to the inside of the cap. A hole may then be drilled clean through both sides of the pipe, when it will allow the air to enter the tank as the petrol level falls, and will not spill over. Or you can bore out and tap the filler cap to take an ordinary Rotherham cycle lubricator; this has a cap which can be opened occasionally to let in the air. The lubricator can be closed when tank is full.

Twin Cylinder Engines at 90°.

I want a magneto for a twin-cylinder engine with cylinders set at an angle of 90°, and have written to the manufacturers, but am informed that it is impossible to fire an engine with cylinders set at that angle with a magneto. They suggest fitting two magnetos, one for each cylinder. However, that idea does not appeal to me, as I do not consider it would be efficient.—H.A.R., Leeds.

H. Cooper, the winner of the first motor cycle race on the new Stadium. He rode Stanley Webb's 1908 Triumph.

It would not be satisfactory to fit a Simms or Bosch magneto to a V twin engine with the cylinders set at 90°, as this would split up the magnetic field too much. The only alternative is to fit one magneto to each cylinder, or to communicate with the makers of the Gianoli magneto, at 26, Boulevard Magenta, Paris. This is driven by a special patented system of gearing which it is claimed enables a magneto to fire V cylinders at any angle.

Knocking in Front Cylinder of Engine.

I have a practically new Peugeot 5 h.p. twin engine (Bosch magneto ignition), and there is a distinct knock in the front cylinder. The combustion chambers have been scraped, and there is no slackness or looseness in any of the bearings. Kindly say to what the knock is due, and if it is under-lubrication, would you advise me to bore holes in the web of crankcase to admit more oil? The knock is apparent even when the front plug is removed.—C.B.

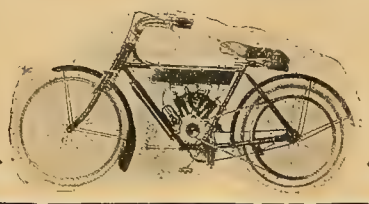
If the bearings are tight, as you say, the knocking must be due to under-lubrication of the front cylinder, and your suggestion of boring holes to admit more oil seems to be a good one. Probably you do not inject oil frequently enough, or there may be some portion of connecting rods or flywheels which touches the crank chamber. Twin-cylinder engines require a charge of oil every five miles at least if the pump is of the ordinary size.

Timing of the Valves.

I have had occasion to rebush both ends of connecting rod of my 3½ h.p. Minerva, and in re-assembling I have timed the same as follows: With piston at top of the stroke and connecting rod moving forward (same direction as motor would travel on road), exhaust valve commences to open a little before piston reaches bottom of stroke, and is nearly full open at bottom of stroke, and closes when piston reaches the top; then inlet valve commences to open on the piston commencing the next forward down stroke, and closes when piston is at lowest point. Is this the correct timing? Timing wheels are not marked. When connecting rod has made one circle, and is on the top of stroke, the valves just balance, i.e., by moving rod slightly forward inlet opens, and if moved slightly backward exhaust opens.—H.L.R., Lichfield.

The exhaust valve should close just as the piston reaches the top of its stroke. If the engine is timed in this way the exhaust opens a little before the end of the working stroke, and the inlet just after commencement of the suction stroke. You appear to have your engine correctly timed.

WHAT HAS BEEN SAID OF IT.



"A Genuine Lightweight. Among the most promising light motor cycles now on the market is the Moto-Reve. If finish and design are guarantees of good behaviour on the road—and to a great extent they certainly are—then the Moto-Reve is all right. . . . The gear is 1 to 6, and the nominal horse-power 2 (on the brake considerably more), so the machine, which, all on, scales but a little over 80 lbs., ought to be a good hill-climber. We may expect to see a considerable number of Moto Dreams about this summer."
—*C. B. Fry's Magazine*, May, '08.

"We have lately been riding a Moto-Reve motor bicycle. The machine is of the lightweight type, a type which we have always recommended, and which we believe is likely to become very popular. . . . We have taken it up some of the steepest hills around Co. Wicklow, and we have never so far had to assist by pedalling. It will run very slowly in traffic, while it will obtain close on forty miles an hour on the level. Owing to its light weight it is a very handy machine."
—*Irish Cyclist*, May 6th, '08.

MOTO REVE

WHAT IT HAS DONE.

LATEST SUCCESS!

ESSEX MOTOR CLUB'S HILL-CLIMB,

MAY 16th, 1908.

Event 1 (Lightweights up to 2½ h.p.)

MOTO-REVE 1st & Fastest Time

NOTE.—The combined weight of machine and rider was over 250 lbs., yet the hill was climbed **without pedalling.**

"The Moto-Reve is apparently highly appreciated in the Nottingham district. A local firm says: 'It has eclipsed any thing we could have imagined. We have already had the machine in thirty motorists' hands, and every one is simply charmed with the amount of power she shows, and the silent and smooth manner in which she runs. . . . We have tested it on all the worst hills in Nottingham, and it has never refused one; and the manner it picks up on hills is simply remarkable. . . . The motorists in Nottingham had not heard of the Moto-Reve; now they can talk of nothing else.'"
—*Cycle Trader*, March 20th, 1908.

A FINE LITTLE MOUNT.

"We have at present on trial a 2 h.p. Moto-Reve lightweight, which the English agents have been good enough to place at our disposal. This alone is a proof of the confidence they have in the mount, and after a hundred miles run we can assure our readers the Moto-Reve has not betrayed it."
—*The Motor Cycle*, February 5th, '08.

Your enquiry for full particulars is invited. Ask for List D.D.

THE MOTO-REVE CO.,
138, Gray's Inn Road, London, W.C.

Address of nearest Agent, where the Moto-Reve may be inspected, sent on request.

The Hall Mark of Mechanical Efficiency. **With 2-Speed Gear.**

Death of the Starting Handle.

Any motor cyclist who has handled a **Phanomen** 2-speed machine, would not think of returning to the **old and laborious method of handle starting**, besides, think of the convenience and comfort, being able to **"start up" in the saddle.** No need to dismount in traffic to re-start the engine. Just the very thing for London traffic or touring in mountainous districts. The gear can be changed so rapidly without any shock, and **both feet being free** to preserve balance when **starting or turning in very confined places,** makes this gear stand out as quite the finest thing in variable gears yet put on the market. **Its reliability** has been proved in both this year's **Quarterly Trials.**

Trial runs with pleasure, by appointment.

A Customer writes—

I have a 3 h.p. Phanomen, magneto, 2-speed NALA Gear, and am delighted with it; it is the centre of attraction round here where the NALA is hardly known. I am endeavouring to persuade my friends to speculate in a Phanomen, as they seem quite satisfied with its performances and **I will not sell mine at any price.** I have had nine motor cycles, but the Phanomen beats all.

Showroom: 49, King Square, President Street, Goswell Road, E.C.; also at the Service Co., Ltd., 292, High Holborn, W.C.

Agent for Cardiff and District—ROBERT BEVAN, 31, Castle Street, Cardiff.

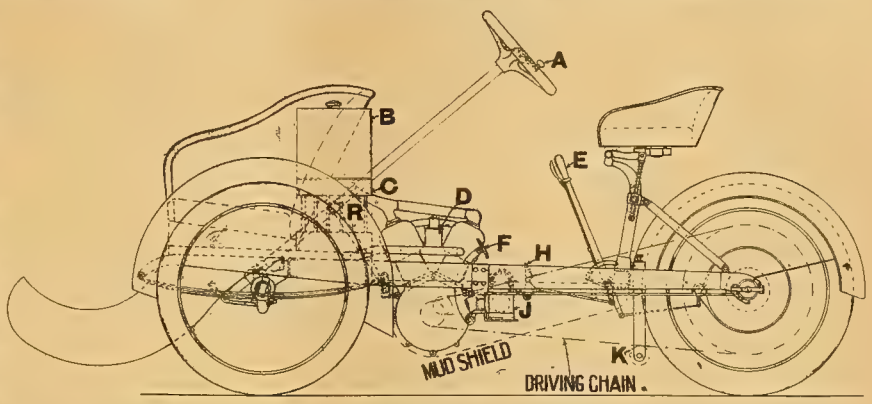
PHANOMEN MOTORS.

A NEW PATTERN TRICAR FOR THE END-TO-END.

A FEW days ago we had the pleasure of examining at the works of the Rex Motor Mfg. Co., Ltd., Coventry, an entirely new pattern Rex Litette which is being built for Miss Muriel Hind, who intends to drive it in the Auto Cycle Union End-to-end Trial, July 13th-18th.

The tricar was not in a sufficiently advanced stage to photograph it, but the line drawing will enable our readers to gain an idea of its construction. There are several details which are worthy of mention.

The frame is of channel steel, supported in front on springs, and the only portions of the frame construction which extend above the main frame are the raked steering tube and a tubular support for the Rex cantilever seat. The engine is of the twin-cylinder water-cooled V-type. It will be noticed that the petrol tank is placed on the top of the two nests of radiators and the water tanks, leaving the frame open and suitable for a lady. The usual Rex two-speed gear in conjunction with the Roc clutch is embodied in the hub of the rear wheel, but in place of belt transmission there is a single chain, with a jockey pulley to keep it always at the same tension and prevent it coming off the teeth of the chain wheels. On the standard Litette the clutch and two-speed gear are operated by means of pedals pivoted on the footrests, but Miss Hind's new tricar will have separate pedals for the clutch and brake, and in addition a side hand lever controlling another powerful rear wheel brake. The machine will be on the road very soon after this description and illustration have appeared, and we recommend our readers who are interested in this form of passenger motor cycle to keep a close eye on the Rex Litette, and note its performances in the forthcoming End-to-end Trial.



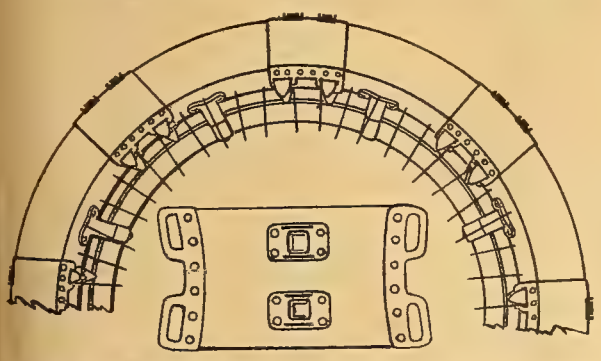
A new pattern Rex Litette which is being built for the End-to-end Six Days' Trial. Miss Muriel Hind will enter and drive this tricar.

A. Carburetter and magneto control. B. Petrol tank. C. Water tank. D. Carburetter. E. Hand brake lever. F. Clutch pedal H. Brake pedal. J. Magneto. K. Jockey pulley. R. Radiators.

THE N.S.U. DETACHABLE NON-SKID.

THE road surface at this time of the year does not tend to make one think seriously of anti-skid devices, but in the particular device we are about to describe certain advantages are embodied, which render it suitable for any weather. Even at the present time heavy showers of rain render the roads dangerously greasy in certain districts, so that any form of anti-skid which may be quickly placed in position will be eagerly welcomed.

We recently called at the N.S.U. Motor Co., Ltd., 78, Charlotte Street, W., and were shown the N.S.U.

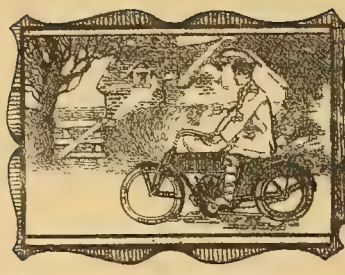


device, which consists of eight pairs of hooks fastened at regular intervals to the rim of a motor cycle rear wheel. These become permanent fixtures. For each pair of hooks a leather band about 3½in. wide is provided, which is easily placed in position if the tyre be slightly deflated. The bands are provided in the centre with square metal plates having rectangular projections. The result is that safety on greasy roads is assured, and danger of slipping on stone setts minimised owing to the amount of rubber exposed being greater than the amount of studded leather. These non-skids need only be used in cases of emergency, as they are so quickly removable, and, moreover, they do not interfere to any extent with the resiliency of the tyre or detract from the power of the engine. Provided the rims will admit of it, the non-skids in question may be fixed to any make of machine. When not in use, the bands can be detached and stowed on any convenient portion of the motor bicycle. Not only the bands, but also the studs, may be renewed when worn.

The device seems to be a distinctly practical one, and quite worthy of this enterprising firm.

Rex motor cycles were very successful in both closed and open events during the week ending May 16th. As will be seen on reference to our "Club News" pages last week, Rex machines scored at Manchester M.C. Hill-climb, Perth and District M.C.C. Consumption Trial, Essex M.C. Hill-climb, Edinburgh M.C.C. Hill-climb, Barnsley Victoria C.C. Hill-climb, and Leeds M.C.C. Reliability Trial for the Kelly Cup.

It may interest many motor cyclists to know that the Continental Tyre Company are marketing a butt-ended tube, the quality of which it is unnecessary to dilate upon, and those who favour this form of tube would do well to write to 102, Clerkenwell Road, E.C., for further particulars



CURRENT CHAT.

SPECIAL FEATURES.

A.C.U. SUTTON BANK HILL-CLIMB.
Photographs of the hill.

THE MOTOR CYCLE T.T. RACE, 1908.

Barnes's Reappearance on the Track.

Geo. A. Barnes signed a contract last week to race in Paris on the 4th and 11th of June, the contract stating that he is to meet any motor cyclist the management like to put forward, and it is very probable that Olieslagers will be one of his opponents. It will be remembered that on Barnes's last appearance in Paris he made a big name for himself, but the accident at Buffalo put a stop to motor racing for the time being, consequently Barnes returned to England.

Motor Cyclists as Royal Flag Bearers.

Describing the mimic battle at Aldershot last Monday week, *The Daily Express* said: "Shortly after eleven o'clock, which was 'dawn' in the theory of the war game, three motor cars, preceded by the motor cyclist scouts flying the Royal flag, sped up the hill from Aldershot Town Railway Station. The King was in the first car, and the Queen, who wore a mauve costume, occupied the second, with her lady-in-waiting. Staff officers brought up the rear. Wherever the tide of battle rolled the King and Queen, accompanied by glittering staff officers, followed in swift motor cars. Ahead of them sped military scouts on motor bicycles, from which the Royal Standard fluttered on a flagstaff attached to each handle-bar. The passing of the Royal party could thus be followed from any high point of the battle ground by the flag-adorned motor cycles."

The New Chairman of the R.A.C.

Mr. C. D. Rose, M.P., finds himself unable to undertake the duties of the chairmanship of the R.A.C., but the committee has, fortunately, obtained the consent of H.S.H. Prince Francis of Teck to accept the chairmanship.

Entries for the End-to-end Run.

Although the preliminary regulations for the A.C.U. six days' ride from Land's End to John-o'-Groat's were only issued last week, the following entries have already been received: J. Tassell, Matchless; W. H. Wells, Vindec Special; S. W. Carty, N.S.U.; W. Ridler, Leader; and E. Nelson, Rex. Of the five mentioned four are private owners. Intending competitors are asked to forward their entries to the A.C.U. secretary early in order to facilitate the organisation of the trial. Moreover, there is a risk of late entries being refused if a large number are received.

A 20 h.p. Motor Bicycle.

The most powerful bicycle in the North of England is a 20 h.p. twin-cylinder engined machine, designed, built, and owned by Mr. C. B. Grimshaw, of Sunderland. The cylinders measure 115 by 125 mm., and the total weight of the machine is 300 lbs.

Speed Trials at Saltburn.

The Yorkshire Automobile Club's speed trials on the sands between Saltburn and Marske will take place on Saturday, June 27th, beginning at 8.30 a.m., if the tide permits. Usually a number of motor cyclists ride to Saltburn to witness these trials.

FUTURE EVENTS.

May 30—Auto Cycle Union Open Hill-climb on Sutton Bank, Yorkshire.
June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and Special Cup for Motor Bicyclists.
,, 6-8—Brooklands A.R.C. Whitsun Meeting.
,, 8 (Whit-Monday)—St. Albans Motor Cycle Races.
,, 8—Tunbridge Wells Motor Cycle Races.
,, 13—Essex Beagles Ten Miles Motor Cycle Handicap at the Stadium.
,, 20—Entries close for M.C.C. Team Competition at Daventry.
,, 24—London United Tramways Five Miles Tourist Motor Cycle Handicap at the Stadium.
,, 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., Liverpool M.C., North West London M.C.C., and Sheffield and Hallamshire M.C.C.
,, ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
,, 4—Brooklands A.R.C. Meeting.
,, 6-7—A.C.F. Grand Prix Races for Cars.
,, 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
,, 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.

The Tourist Trophy Race.

It is highly probable that the Tourist Trophy Race for motor cycles in the Isle of Man will be held in September instead of October. There are many things in favour of the earlier month, and we hope it can be arranged.

Fowls on the Road.

While riding on the Chester Road, Sunderland (the main highway from Sunderland to Durham), in the vicinity of North Hall Farm, Mr. T. Jameson, of the Sunderland and District M.C.C., had the misfortune to kill a hen, and was himself thrown into a ditch, resulting in his forehead and knee being badly cut. We understand fowls frequently run across the road from one field to another at this point, and several other spills have occurred, so motor cyclists should ride warily when near North Hall Farm.

"Cudham Bank" Sounds Strange.

To the Londoner the Yorkshire way of referring to every hill as a "bank" sounds as strange as "yonder," "coop," and other words peculiar to the broad Yorkshire dialect. In the South, of course, bank is only used in referring to riverside slopes and margins of the road, and to enquire of a Southerner whether his machine would climb banks would be akin to asking if it could be ridden over ploughed fields!

Sir Frederic Phillipson Stow, Deceased.

It is with great regret that we have to announce the death in London of Sir Frederic Phillipson Stow. The late Sir Frederic, who was created a Baronet last year, was one of the founders of the De Beers Company. Motor cyclists will long remember the kindness the late Baronet extended to the Auto Cycle Union in allowing the use of his grounds at Blackdown House, Haslemere, for its yearly hill-climb.

Getting Further Out.

Many motor cyclists are following the example of car owners and taking up their residence in the more outlying suburbs, where there are green fields, smoother roads, and no 'buses, trams, and deadly tram lines. Localities like Clapham and Brixton are losing popularity. Now motor owners prefer such places as Beckenham, Bromley, or Chislehurst, where they gain immediate access to the country and their favourite roads. Enterprising builders and estate agents at these places offer inducements by agreeing to build up-to-date motor houses at a five per cent. rental. Truly, the motor is responsible for a lot of changes. Even Westerham and the district is being opened up to city goers by a new motor 'bus service to Sevenoaks Station.

Whit-Monday Track Races.

On the St. Albans track, on Whit-Monday, the following motor cycle races will be held: Five miles invitation scratch race, five miles handicap (limited to engines 76 by 76 mm.), five miles tourist handicap (for machines not exceeding 85 by 85 mm. with a 4 to 1 gear). The hon. sec. of the meeting is A. F. Slater, 1, Bedford Park Road, St. Albans.

At Tunbridge Wells there will be a three miles scratch race and a five miles handicap (limited to engines 76 by 76 mm.) Hon. sec., H. Saville, St. John's, Tunbridge Wells.

The M.C.C. Team Competition.

The Sheffield and Hallamshire M.C.C. is the eighth club which has signified its intention of sending a team to compete for *The Motor Cycle* Challenge Cup at Daventry on the last Saturday in June.

Police Trap.

We are informed by a correspondent that the police are particularly active near Lancaster. At Scorton, two miles south of the aforementioned town, our correspondent was stopped for riding at twenty-three miles an hour, although he was aware of the trap and was travelling very slowly at the time.

Police Traps near Lancaster.

Motor cyclists riding through Lancaster should be watchful between Garstang (eleven miles south) and Burton (eight miles north of Lancaster), as the police have lately been very busy timing motorists, and the magistrates give every encouragement to the police.

South-eastern Auto Cycle Association.

Unattached riders in South-east London can join the above association at a subscription of 5s., and derive benefits similar to members of clubs which are affiliated to the A.C.U. The hon. secretary's address will be found on the last page of this issue.

A.C.U. Sutton Bank Hill-climb.

We are informed by a correspondent that the police will be particularly energetic on different parts of the road between York and Scarborough during the season, especially on Military Sunday, 31st May, which follows the Sutton Bank Hill-climb on Saturday, 30th. London motor cyclists should note the route referred to in our issue of May 13th, page 377.

The Rule of the Road.

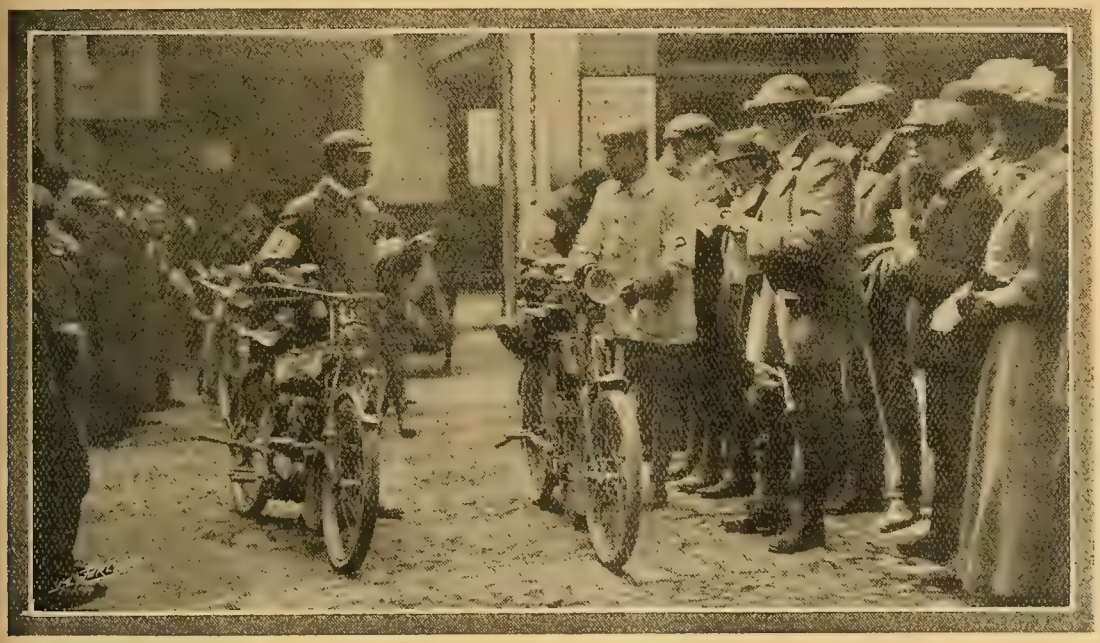
We have received a very lengthy letter from the hon. sec. of the Junior Automobile Association, Mr. C. W. Brown. This letter relates to a very decided rule of the road clearly laid down by Act of Parliament. Our space is so crowded it is impossible to reproduce the letter *in extenso*, but a list of offences under section LXXVII. (78) will be found on pages 114 and 115 of the Motor Car Acts 1896 and 1903, published by Iliffe & Sons Ltd., 20, Tudor Street, E.C.

An Enterprising Club.

In addition to being represented in the team competition at Daventry next month, the Sheffield and Hallamshire M.C.C. will have four members in the Land's End to John-o'-Groat's run in July, as the president (Mr. J. H. Hall), Messrs. F. Dover, F. W. Farrer, and Jno. Haslam, are entering for this classic event.

A Smart Answer Wins a Motor Bicycle.

The result of the competition for the K.D. lightweight motor bicycle is announced this week. The judge, Mr. B. H. Davies, has decided that Mr. Ernest A. Carr, South Western Police Court, Lavender Hill, S.W., gave the best reason why he should be awarded the K.D. machine offered by Leo Ripault and Co., 64a, Poland Street, London, W., his reason being: "Because my life as a magistrates' clerk has been devoted to the interests of the Cadi (K.D.)"



The North West London Twelve Hours' Reliability Run, London to Coventry and back. Starting competitors on the return journey from the King's Head Hotel, Coventry. Left hand, No. 1, A. Stanley Phillips (5 h.p. Vindec). Right hand, No. 2, E. W. Brighten (2½ h.p. Ariel). The checker on the right is E. J. Hardy (Coventry M.C.).

The Motor Cycle and the Lay Press.

A good sign is the increasing friendliness of the lay press towards the sport and pastime of motor cycling. The daily papers refer more often to the pleasures to be derived from the motor cycle, and in the June issue of Fry's *Magazine* there is an interesting article on the subject which makes excellent reading.

The World's Hour Record.

Joseph Guippone's world's motor cycle record of 63 miles 1,078 yards, accomplished at the Parc des Princes track, Paris, in December of 1905, does not promise to be disturbed as far as riders abroad are concerned, but it is rumoured that three well-known British racers contemplate early onslaughts. The venue will, of course, be Brooklands, and there is no doubt that with an up-to-date machine several miles can be added on to the present world's best for 60m. One of the daring cracks suggests seventy miles

The End-to-end Trial in July.

The preliminary regulation and entry forms for the A.C.U. Land's End to John-o'-Groat's six days' trial of motor cycles, July 13th to July 18th, are now obtainable from the secretary, 18, Down Street, Piccadilly, W. In 1906 no less than ninety-three machines were entered for this trial, and large crowds welcomed the riders in the numerous towns and villages passed through. The present competition promises to be even a greater success, so many enquiries having been received by the A.C.U. secretary with regard to the event. Entries close four weeks hence

Cambridge M.C.C. v. Cambridge University M.C.C.

The result of the inter-club hill-climb at Croydon Hill on Saturday last between seven representatives of each club was: Average figure of merit C.M.C.C., 12.813; average figure of merit C.U.M.C.C., 13.836. The weather was good and the fixture a great success. On formula, the competitors finished in the following order:

1. H. H. Harper, 2¾ h.p. King.
2. W. King, 2¾ h.p. King.
3. C. W. Wilson, 2¾ h.p. King.
*4. F. Dickson, 5 h.p. twin Vindec.
*5. E. Dickson, 5 h.p. twin Vindec.
*6. W. Hutchinson, 3½ h.p. Triumph.
7. F. T. Cox, 2¾ h.p. King.
8. F. Pryor, 2¼ h.p. Humber.
*9. J. M. Oakey, 5 h.p. twin Vindec.
*10. W. G. Ross, 3½ h.p. Triumph.
11. A. J. Mihill, 2¾ h.p. King.
*12. A. R. Murray, 3½ h.p. Triumph.
*13. F. Pilkington, 3½ h.p. Triumph.
14. B. L. Peters, 3½ h.p. Minerva.

*University Team.

North West London M.C.C.

THE twelve hours run to Coventry and back on Saturday last attracted twenty-six entries, and of these twenty-five started. The competitors and friends were at the starting point (Jack Straw's Castle, Hampstead Heath), at 6.45 a.m. It was a beautiful, bright morning, and all looked forward to a good run. The machines were inspected and sealed by the judges, and punctually to the minute the first competitor was despatched, the remainder followed at half-minute intervals without any delay.

The route lay through Edgware, and immediately afterwards Brockley Hill was encountered. After this there was a clear run through Watford to Berkhampstead, the first "check." Competitors were not long in getting away again, and on through Tring and Aylesbury to Bicester, the second "check." After this the road became more tortuous to follow, but owing to the excellent manner in which Mr. A. Stanley Phillips, the trials honorary secretary, had arranged for the marking and marshalling of every corner, there was no difficulty in following the correct route. After traversing the magnificent country about Enstone and Long Compton, the final "check" at Shipston was reached. Here most of the competitors took in petrol before starting on the last stage through the interesting country about Warwick and Kenilworth. Close to the latter town an unfortunate mishap occurred to F. Thomas, the steering column of his machine breaking. Fortunately, he was not hurt, and after putting in for repairs he was able to return to London with the rest of the competitors.

Coventry was reached in good time by the majority. An hour here was allowed for lunch, which was taken at the King's Head Hotel. The thanks of the club are due to Mr. Eric W. Walford and the members of the Coventry Motor Club for their invaluable assistance in checking and timing the arrival and departure of competitors at Coventry, and also for marking and patrolling the road from Shipston.

Again punctually to time the survivors were despatched on the return journey, which was made by the same route as the outward journey. There were large crowds at Hampstead Heath to see the finish, and had it not been for the assistance of the police some difficulty would have been experienced in taking the times of the returning competitors.

The following completed the double journey within schedule time, and will each be awarded a silver cup:

A. Stanley Phillips (5 h.p. Vindec), G. Rowden (3½ h.p. Bat), E. Gwynne (3½ h.p. Vindec), Miss M. Hind (5 h.p. Rex), W. H. Pidgeon (3 h.p. Goldhurst), C. J. Burton (3½ h.p. Vindec with sidecar), S. A. Knaggs (2½ h.p. Ariel), G. H. Hollis (3½ h.p. Triumph), H. G. Cove (3½ h.p. H.G.C.), W. A. Jacobs (3½ h.p. Rex), G. Bennett (3 h.p. Marlborough), M. Tuckmann (3½ h.p. Triumph), C. H. Crole-Rees (6 h.p. Advance), M. Campbell (5 h.p. Vindec), W. G. Barton (3 h.p. Triumph), T. G. Blundell (3½ h.p. Triumph), D. K. Edwards (2¾ h.p. M.M.C.), and E. W. Ashworth (7 h.p. Minerva) E. W. Brighten (2½ h.p. Ariel), and C. Williams (2¾ h.p. Brown) finished just outside schedule time.

The club is greatly indebted to the judges, Messrs. R. G. Booth and L. Van der Velde, and all the checkers.

The starting point of the North West London M.C.C. Twelve Hours' Reliability Run. Competitors and friends assembled at Jack Straw's Castle, Hampstead Heath on Saturday last. Time, 6.45 a.m.

Entries for the A.C.U. Sutton Bank Hill-climb.

THE following is a list of the entries received by the secretary of the Auto Cycle Union up to Friday night for this event, which is to take place on Saturday:

Class 1, lightweight machines.—Gordon L. Fletcher (2 h.p. Moto-Rêve) and Robert G. Bell (2 h.p. Moto-Rêve).

Class 2, maximum bore 82 mm.—R. M. Brice (3½ h.p. Brown), Eric S. Myers (3½ h.p. Triumph), W. A. Jacobs (3½ h.p. Rex), J. P. Le Grand (2½ h.p. Matchless), Felix Scriven (3½ h.p. Rex), Robert Ellis (3½ h.p. Rex), H. Newey (3½ h.p. L.M.C.), F. W. Applebee (3½ h.p. Rex), and S. W. Carty (3¾ h.p. N.S.U.)

Class 3, single cylinders, maximum bore 85 mm.—R. M. Brice (3½ h.p. Brown), Gordon Gibson (3½ h.p. Triumph), W. E. Grange (3½ h.p. Triumph), Eric S. Myers (3½ h.p. Triumph), W. A. Jacobs (3½ h.p. Rex), W. G. McMinnies (3½ h.p. Triumph), W. J. Newsome (3½ h.p. Triumph), J. Marshall (3½ h.p. Triumph), Robert Ellis (3½ h.p. Rex), F. W. Barnes (3½ h.p. Zenette), and F. W. Applebee (3½ h.p. Rex).

Class 4, multi-cylinders, maximum bore 76 mm.—W. H. Wells (5 h.p. Vindec Special), J. E. Truefitt (5½ h.p. G.B.), J. Scriven (5 h.p. Rex), T. H. Tessier (6 h.p. Bat), —. Gibson (———), J. F. Mallett (6 h.p. N.S.U.), F. W. Applebee, sen. (5 h.p. Rex), F. W. Applebee (5 h.p. Rex), and G. W. Raper (6 h.p. N.S.U.)

Class 5, multi-cylinders, maximum bore 85 mm.—W. H. Wells (5 h.p. Vindec Special), J. Scriven (5 h.p. Rex), T. H. Tessier (6 h.p. Bat), Robert Ellis (7-8 h.p. Minerva), J. F. Mallett (6 h.p. N.S.U.), F. W. Applebee (5 h.p. Rex), and F. W. Applebee, jun. (5 h.p. Rex).

Class 6 (open to entrants in any of the above classes).—W. H. Wells (5 h.p. Vindec Special), J. E. Truefitt (5½ h.p. G.B.), J. Scriven (5 h.p. Rex), W. E. Grange (3½ h.p. Triumph), Eric S. Myers (3½ h.p. Triumph), W. A. Jacobs (3½ h.p. Rex), W. G. McMinnies (3½ h.p. Triumph), W. J. Newsome (3½ h.p. Triumph), J. Marshall (3½ h.p. Triumph), Robert Ellis (7-8 h.p. Minerva), F. W. Applebee (5 h.p. Rex), and F. W. Applebee, jun. (5 h.p. Rex).

Class 7, variable gear class.—C. A. Palmer (5 h.p. Roc), W. Milners (3½ h.p. Phelon and Moore), H. Howarth (5 h.p. Vindec Special), H. C. Griffin (3½ h.p. J.A.P.), —. Gibson (———), R. Moore (3½ h.p. Phelon and Moore), G. E. Vint (3½ h.p. Phelon and Moore), F. W. Barnes (3½ h.p. Zenette), and G. W. Raper (6 h.p. N.S.U.)

Class 8, passenger class.—R. M. Brookes (9 h.p. Riley), R. B. Smith (6 h.p. N.S.U.), and A. D. Nicholson (9 h.p. Riley).

Motor Cycle Racing at Birmingham.

THREE-CORNERED MATCH AND OTHER RACES.

Start of the final race for the Five Miles Tourist Handicap. Reading from the right: V. Yates (3½ h.p. Rex), J. C. Smyth (3½ h.p. Rex), H. A. Collier (3½ h.p. Matchless-Jap), and C. R. Collier (3½ h.p. Matchless-Jap). Yates won in 7m. 48s.

SOME four or five years have elapsed since motor cycle racing was a feature of sports meetings at Aston. At the *Sport and Play* tournament on Saturday last there were five events, including a series of matches between H. Martin, C. R. Collier, and H. V. Colver. It is estimated about 12,000 people were present.

Five miles tourist motor cycle handicap: Heat I.—C. R. Collier (3½ h.p. Matchless-Jap), scratch, won easily. Time, 7m. 58⅘s.

Heat II.—W. Pollard (2 h.p. Central-Minerva), 80s. start, lapped Yates (3½ h.p. Rex), 25s. start, but was disqualified owing to high gear and 1¾in. tyres instead of 2in., and race awarded to Yates.

Heat III.—A. J. Greenway (2¾ h.p. Humber) retired. This heat was won by H. A. Collier (3½ h.p. Matchless-Jap). Time, 7m. 36⅘s.

In the final Yates rode splendidly, and practically maintained his start, C. R. Collier being 2nd and J. C. Smythe 3rd. H. A. Collier punctured. Time, 7m. 42s.

One mile race between H. Martin and C. R. Collier.—Collier rode very well, and won by about ten yards. Time, 1m. 30⅘s.

Three miles race, C. R. Collier *v.* H. V. Colver.—Colver was riding Martin's machine, as his own refused to fire, and this undoubtedly handicapped him. Collier won in 4m. 15⅘s.

Five miles race, H. V. Colver *v.* H. Martin.—Colver rode his own machine, and put in a splendid race, winning by about twenty yards in 7m. 1⅘s.

C. R. Collier therefore won the match by two points, Colver 2nd, Martin 3rd.

One mile tourist motor cycle handicap.—The outstanding feature of this event was the success of the three Rex machines ridden by Barker, Smythe, and Yates. The Colliers were giving starts up to 300 yards. In the final for this race, Barker on the 2¾ h.p. Rex was 1st, Smythe 2nd, and Yates 3rd. Time, 1m. 32⅕s.

Five miles light motor cycle handicap, limited to 76 by 76 mm.—The competitors were allowed to ride without silencers on their machines. Only two heats were contested, and in the final the placing was Colver, Martin, C. R. Collier, and Edmundson. The last-named was riding a Derwent with J.A.P. engine, but was badly troubled with misfiring, or would have done much better, as his machine evidently possesses a good turn of speed. Time, 7m. 3⅗s.

The M.C.C. London to Edinburgh Ride.

COMMENTS AND LIST OF ENTRIES. By S. H. FRY.

JUDGING by the number of entries to date for this event its popularity with all classes of motorists remains as strong as ever. Indeed, the number of members of the club who have intimated their intention of starting from Highgate on Friday evening, June 5th, this year creates a record. As the club committee meet after these lines are written to elect new members, it is extremely probable that the total number of entries will reach the figure of 110.

The principal entry naturally consists of motor bicycles, from the little 1¼ h.p. Motosacoche to the great 9 h.p. J.A.P. This is as miscellaneous an entry as any motoring sportsman could desire. The tricar entry so far consists of a fleet of Lagondas, and the sidecars are limited to two only. Personally, I am disappointed in this last, as the sidecar seems to me so essentially the poor man's two-seated motor car.

As regards the car entries, I would like to say that almost all the drivers are old motor cyclists, many of them (myself amongst them) still owning and driving motor cycles. (See *The Autocar* for May 30th, where car entries will be dealt with.)

The arrangements along the route are well in hand, and almost all the checks and controls are settled, and, figuratively speaking, the men in their places. Most of our old friends are continuing to help, and very kind indeed it is of them, and much appreciated.

All that I am hoping for now is fine weather and good roads, and the pleasure of being able "to get there" myself so as to meet the host of the successful ones. One last word: Please drive considerately and cautiously all the time, so that in future years our annual run may be a pleasant anticipation to others as well as members of the Motor Cycling Club.

The M.C.C. London to Edinburgh Ride.—

BICYCLES.

Rider and machine.	No. of cylinders.	Ignition.

*W. A. Jacobs (3½ h.p. Rex)	1	Mag.
A. G. Peppercorn (2¾ h.p. Anglian)	1	Accu.
M. Campbell (5 h.p. Vindec Special)	2	Mag.
Dr. C. B. Moss-Blundell (3½ h.p. Zedel)	1	Dry batt.
*J. P. Le Grand (2½ h.p. Matchless)	1	Mag.
*G. L. Fletcher (2 h.p. Moto-Rêve)	2	Mag.
W. H. Bashall (3½ h.p. Triumph)	1	Mag.
H. C. Sayer (3½ h.p. Triumph)	1	Mag.
*W. Pershke (4 h.p. Diamond)	2	Mag.
Dr. C. Gibbons (3½ h.p. Minerva)	1	Accu.
*A. Stanley Phillips (5 h.p. Vindec)	2	Mag.
C. F. Lacey (3½ h.p. Fafnir)	1	Mag.
*O. L. Summers (3½ h.p. Vindec)	1	Mag.
A. Walton (5 h.p. Vindec Special)	2	Mag.
J. Cooper (3½ h.p. Triumph)	1	Mag.
V. H. Deuchar (5 h.p. Vindec Special)	2	Mag.
*R. O. Clark (5 h.p. F.N.)	4	Mag.
A. T. Browett (3½ h.p. Triumph)	1	Mag.
G. E. Roberts (3½ h.p. Triumph)	1	Mag.

* Entrants for Schulte cup competition and special cup for motor bicyclists.

TRICARS.

Dr. E. W. Brewerton (10 h.p. Lagonda)	2	Accu.
M. W. Randle 10 h.p. Lagonda)	2	Accu.
F. Cozens (10 h.p. Lagonda)	2	Accu.
H. S. Freeman (10-12 h.p. Lagonda)	2	Accu.

SIDECARS.

W. Montgomery (3½ h.p. Minerva)	1	Accu.
P. W. Vinsen (6 h.p. Clifton-Jap)	2	Accu.

CLUB NEWS.

Essex M.C.

The inter-club trial with the West Essex A.C. last Saturday resulted in a tie, and the competition will be run again.

Southend and District M.C.

A party of members and friends of this club, numbering about twenty, met last Wednesday evening for an informal club supper at the Crown Hotel, Rayleigh. The event proved a most successful and enjoyable one.

Perth and District M.C.C.

The Perth and District and Falkirk and District M.C.C.'s had a friendly meet at Rumbling Bridge, which is practically equidistant from the two headquarters. There was a good turnout, and as weather and road conditions were favourable, the run was much enjoyed. Next Saturday a reliability trial will be held.

Hull and East Riding A.C.C.

A large party of members propose attending the A.C.U. hill-climb at Sutton Bank on Saturday, and York the following day (Military Sunday). The first detachment will leave the Paragon Square, Hull, at 6.30 p.m. on Friday, staying the night at the club headquarters in York. The second will assemble at the Paragon Square on Saturday at 9 a.m. Both parties will meet in York and proceed to Sutton Bank, and return to York for the night.

Western District M.C. (London).

A reliability run was held on the 16th inst., the course being from Hounslow to Bath and back, a distance of 188 miles. The winner proved to be the captain of the club, who was mounted on a brand new machine. Result:

1. H. Vowler (3½ h.p. Triumph).
2. H. Kirk (5½ h.p. twin Brown).
3. R. Babbage (3½ h.p. Minerva).

The run in conjunction with the Eastern District M.C. will be held on June 28th, not May, as announced in former issue.

Coventry M.C.

For the twelve hours club run to Holyhead (165¼ miles) on Saturday next thirteen motor bicyclists have entered, one tricarist, and thirteen car owners. Competitors will be started at 7 a.m. from the railway bridge on the Holyhead Road, Coventry.

Barnsley Victoria C.C. (Motor Section).

The official results of the hill-climb are given on the next page. The list of awards is: 1st, Triumph gold medal; 2nd, Pratt's gold medal; 3rd, prize given by Mr. Greenwood, Leeds; 4th, Mr. J. R. Parker's medal for fastest time, won by T. Dunk (5½ h.p. Rex). P. G. Cockroft, after the event, ascended the hill in the fastest time, but we are asked to point out that he is not a member of the organising club.

Halifax and District M.C.C.

The first meeting was held on Thursday last, when the following officers were elected: President, Mr. A. H. Forbes; vice-president, Dr. Hughes; captain, Mr. C. Clarkson; vice-captain, Mr. H. Naylor; hon. treasurer, Mr. M. Youngman; hon. secretary, Mr. H. D. Helliwell, 7, Harrison Road, Halifax. It was decided to affiliate to the A.C.U., and Maude's Temperance Hotel was appointed headquarters.

Leeds M.C.C.

Thirteen competitors for the Kelly Cup on the 16th inst. made absolute non-stop runs, viz., Messrs. Atkinson, Bagshaw, Cockroft, Durant, Greenwood, Forbes, Hickman, Hyde, Foster, Horner, Lerwin, Tennant, and Wheater. Messrs. Greenwood and Tennant finished a dead-heat, so the following day they met again, and after travelling fifty miles Tennant's machine punctured, leaving F. W. Greenwood, who rode 3½ h.p. Rex, winner.

Owing to the A.C.U. Sutton Bank hill-climb on Saturday, the Leeds club has abandoned the minor competition arranged for the same day.

Club News.—

West Essex A.C.

The next club competition is the 100 miles reliability run for motor cycles only for the club cup and will be held on Saturday, June 13th.

Newcastle M.C.

On the 7th prox. the run is to Barnard Castle. A non-stop trial of 114 miles will be held on Whit-Monday for the Alan Robson challenge shield and other prizes. The route will be Newcastle to Jedburgh and back *viâ* Ponteland, Belsay, Knowesgate, Otterburn, and Carter Fell.

Bolton and District M.C.C.

A reliability test has been arranged for Saturday, the 30th inst., to Gisburn, leaving Town Hall Square 1.45 p.m. Entries close on Friday, and should be sent to the hon. sec., A. Richards, Sunny View, High Street, Bolton.

Cardiff M.C.

The hill-climbing competition at Rhubina Hill attracted twelve entries from motor cyclists, and all started. The hill is about two-thirds of a mile in length, and the gradient 1 in 6 at the steepest part. The fastest time was accomplished by W. Pollard, on a 3½ h.p. Thomas Silver; he also heads the list on formula. J. N. Wyndham, who rode a 2 h.p. Central Minerva, was second on formula, his performance being particularly meritorious.

Barnsley Victoria C.C. (Motor Section).

The club hill-climb in Stainborough Park (kindly lent by Captain B. C. Wentworth) was most successful, considering how it was handicapped in every way by the abominable weather. Result on Prof. Callendar's formula:

	Rider and machine.	Time.	Fig. of merit.
1.	B. S. Ledger (2½ h.p. Jap) ...	55⅖s.	56.56
2.	E. Slater (3½ h.p. Triumph) ...	41⅖s.	59.71
3.	E. Atkinson (3 h.p. Triumph)	54⅖s.	62.48

There were fifteen entrants and eleven starters.

Welsh A.C.

On Friday, June 5th, a motor cycle hill-climbing competition will be held at Philadelphia Hill, Carmarthenshire. There will be two classes—(1) For machines of any power, and (2) not exceeding 60 by 70 mm. The winner of Class 1 will hold the Cory Yeo Challenge Cup, and the prize for Class 2 is a Motor Union silver medal. The A.C.U. formula, $\frac{W}{C \times T}$, will be used. Entry fee (5s.) should be sent to the hon. secretary, Mr. J. Shimell Andrew, Rutland Street, Swansea.

Sunderland and District M.C.C.

The hill-climbing competition at Tunstall Hope, near Sunderland, on the 16th inst., was a great success. The results on formula were:

Class I.—1, J. Kirton (3½ h.p. Minerva), figure of merit 182; 2, F. Turvey, jun. (3½ h.p. Triumph), 171; 3, W. F. Cross (3½ h.p. Minerva), 169; J. Scott (2¾ h.p. Minerva), 155; J. Jack (2½ h.p. Rex), 136; and B. Grimshaw (3½ h.p. Grimshaw), 127.

Competitors in the Perth and District M.C.C. Consumption Trial. The winner, C. Livingstone, rode a 3½ h.p. Rex, which consumed petrol at the rate of 145 miles to the gallon.

Class II.—1, E. J. Tiffin (4½ h.p. Minerva), 178; 2, W. Armstrong (5 h.p. Mowbray), 141; 3, Lambert (5 h.p. Rex), 139; W. R. Jackson (5 h.p. Rex), 125; B. Grimshaw (6 h.p. Grimshaw), 121; A. Hines (6 h.p. N.S.U.), 117; and B. Grimshaw (20 h.p. Grimshaw), 53.

Class III., open to members of the North-Eastern Automobile Association (single-cylinder machines).—1, J. Kirton (3½ h.p. Minerva), 189; 2, W. F. Cross (3½ h.p. Minerva), 162; 3, F. Turvey (3½ h.p. Triumph), 157; and J. Jack (2½ h.p. Rex), 130. W. Broadway (3½ h.p. Rex) and J. Scott (2¾ h.p. Minerva) were also among the competitors. Twin-cylinder machines: 1, E. J. Tiffin (4½ h.p. Minerva), 175; 2, W. Armstrong (5 h.p. Mowbray), 152; 3, Lambert (5 h.p. Rex), 148; Raper (6 h.p. N.S.U.), 130; W. R. Jackson (5 h.p. Rex), 126; B. Grimshaw (6 h.p. Grimshaw), 119; A. Hines (6 h.p. N.S.U.), 113; and B. Grimshaw (20 h.p. Grimshaw), 57. The record for the hill was beaten by Mr. Grimshaw, who rode a 20 h.p. bicycle fitted with a huge twin-cylinder engine, by 1⅘s.

Proposed Club for Fife, N.B.

A meeting of motor cyclists is to be held at the Bowhill Hotel, Cardenden, Fife, on Friday, the 29th, at 7.30 p.m., in order to form a motor cycle club. The proposed name is the Fife M.C.C. All riders in the district are invited to attend.

Seventeen members of the Leeds M.C.C. competed or the Kelly Cup on the 16th inst.

Mr. J. R. Kelly is seated on the motor bicycle in the centre. The course was eighty miles in length.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Sidecars and Single Gears.

[3329.]—Referring to my letter published under above heading in your last issue, I should have stated that my weight is just over eleven stones. C. G. K.

The A.C.U. Quarterly Trials.

[3330.]—Kindly allow me to draw attention to the way in which amateurs were treated over the last Quarterly Trials. By changing the day from Saturday to Wednesday the average amateur, with a business to attend to, was practically barred from entering. I, myself, and two others who had intended to ride were unable to compete for this reason alone.

EDGAR W. BRIGHTEN,
North-west London M.C.C.

Tricar Improvements.

[3331.]—Referring to the paragraph under the heading of "Occasional Comments," by "Ixion," in *The Motor Cycle* of May 13th, in which is described and illustrated a special byepass attachment and throttle which we fitted to a 9 h.p. Riley tricar, we notice in the footnote that this idea forms the subject matter of a patent by O. Imry. We do not quite see how Mr. Imry can possibly patent this device, as we have fitted it to a very great number of cars during the past few years. It was, in fact, through a customer seeing it work so satisfactorily upon a 15 h.p. Peugeot car that made him ask us to fit it to his tricar. Among other cars, we have fitted it to a 100 h.p. racing car, and it works with perfect satisfaction. The idea we have always claimed to be original, and we arrived at it only after a great deal of experimental work. CHAS. GRIMSHAW AND SONS.

[3332.]—I was much interested in the 9 h.p. Riley tricar improvements described by "Ixion" in the issue of May 13th. With reference to the carburetter improvement and to your contributor's remarks, I may point out that the suggestion is a marked improvement on the old arrangement of drilling a hole in the throttle valve to supply sufficient gas to keep the engine running for two reasons. Firstly, it is extremely difficult to get a carburetter which is efficient at high speeds to run an engine very slowly, unless it has a variable jet and choke tube. Practically all the well-known carburetters which do run an engine very slowly are provided with a number of jets which are opened progressively, or a single variable jet, which has the same effect, as in the White and Poppe. Secondly, the operation of the additional jet is not affected by the position of the extra air inlet.

With the drilled throttle, consider a case in which one is travelling fast, with the throttle fully open, and a sudden stop necessitates releasing the accelerator, causing the throttle to shut and the engine to be fed through a small hole only. One has no time to shut the extra air inlet, and the result is that the engine is stopped through weakness of mixture.

I presume that the extra nozzle is slightly higher than the Longuemare jet, so that tilting of the carburetter does not cause flooding. I should like to know whether the tap on the additional pipe is a necessity. I very much doubt if this is intended to be closed when the carburetter is used normally, but should imagine it is to be set in one position, the position to be found by experiment.

ERIC W. WALFORD.

Remarkable Occurrences!

[3333.]—We should like to inform you of some remarkable occurrences during our last Bank Holiday ride. One of us ran over a mole, which now sees perfectly. This happened just as we had completed our 255th mile on a quart of petrol each. A few miles further on there was a loud report, and the gudgeon pin of the foremost machine blew out through the cylinder wall. This delayed us but little time, for after wrapping a tyre puttee round the cylinder we went merrily on at forty-five to the Finchley gentleman's forty and yet there was no excitement.

On the return journey the bicycle which had still retained its gudgeon pin misfired violently. We took the carburetter down and found in it the errant gudgeon pin and other such particles which a carburetter usually contains. Replacing the gudgeon pin in its proper place we lightly leapt on to our machines and returned home in excellent spirits.

LI 01 AND AR 02.

Repairing Petrol Tanks.

[3334.]—In your issue of May 13th I notice in "Current Chat" a warning from "F.W." to tank repairers. Whilst admitting that every care should be taken when petrol is anywhere near, I fail to see how "F.W.'s" tank should have burst in such a manner. I myself repaired a tank by soldering, and the way I did it was this: I drained all the spirit out of the tank, cleaned the faulty joint, and then soldered in the usual manner. *I was careful to see that the filling cap was removed,* so that any gas that was made by the hot iron in contact with the cold tin could escape; also to keep far enough away from the blow-lamp. If "F.W." did these two things, I fail to see how an explosion could happen. I might say that I did not wash tank out, but just drained it and then soldered. LLEWEN SIDE.

Colonial Requirements.

[3335.]—I read with much interest Mr. Braybrooke's experiences of motor cycles on colonial roads. I see he is also against chain drive. He says he rode the first chain-driven motor cycle in Cape Colony. We all know the first chain-driven motor cycles were not much use, but has he tried a 1907 or 1908 Phelon and Moore? I have a letter here from the P. and M. Co. telling me to place my order early, as they are already booked six or eight weeks ahead, so there must be something good in chain drive. How is it that there is a cry for a twin motor cycle two-speed and free-engine and chain drive? If it behaves all right on a twin, why should it not on a single? We all know what a nuisance a belt drive is on a rainy day; it is little better than useless.

To compare the chain drive of years ago with that of to-day one might as well compare round belts of years ago to the up to date V belts. There must be at least 4½in. clearance between bottom of crankcase and ground. All motorists here know that King district roads are the worst in Cape Colony. Only recently a man riding a Dürrkopp motor bicycle struck the bottom of the crankcase on a rock, going up hill. It knocked a big dent in the crankcase and jammed the fly-wheel. Whilst two chums and I were out riding on the main road some time ago I knocked the bottom of my 1907 Triumph, and my friends both knocked theirs—the one a 1908 Triumph and the other a 3½ h.p. 1907 N.S.U. The exhaust pipe on the N.S.U. was dented until it closed. The place where we all struck was a ridge of rock across the road. Again, where a machine with 6in. clearance scores is when pushing the machine through a river drift.

We have never had a belt, rubber, or leather to last us longer than six months' riding. I have ordered a few Whittle Link Grip belts, and I hope that they will give satisfaction. I am glad Mr. Braybrooke answered my letter, because I

would like to correct a little error I made in stating that there were no motor repairers on this side of Johannesburg. What I really meant was that I believe that it is impossible to get spare parts for the machines running here, namely, 1907 and 1908 Triumphs, N.S.U.'s, Dürrkopps, and Wanderers. I can get most of them at Johannesburg. I would not write there if I could procure them nearer.

There is a first-class motor repairer, turner, and fitter at East London (Mr. J. R. Manning), who is a good workman, and one who has served his time in one of the best fitting shops in Cape Colony. CONRAD HILNER.

[3336.]—Mr. A. W. Wall, in writing on the subject of suitable machines for Australian roads [letter 3105] (I presume he has ridden all over Australia on a motor cycle), says "English makers in touch with the market readily comply with colonial requirements." I maintain that, with one exception, they do nothing of the sort, and I would like to ask Mr. Wall that if such is the case, how is it that several machines recently sent out to Melbourne are fitted with rigid forks, when good spring forks are most essential to comfort and safety on our roads?

I agree with him that it is a pity that English machines are outnumbered by the various Continental makes, but when English makers send out such an absurd twin-cylinder machine as the one I was unfortunate enough to import, with its 220 lbs. weight and 1½in. of crank case clearance, there is no longer any wonder why English machines are outnumbered.

Mr. Wall thinks that the comparison would all be in favour of the English machine in design and workmanship. Perhaps it would in England, where English makers have to produce a sound article to hold their own in the market.

If a list of the defects, which my late English machine of alleged sound design, developed during its first 500 miles, were known, it would be an object-lesson for most motor cyclists.

I have ridden English and foreign machines on English roads, also English and foreign machines in Australia, and in my opinion Continental motor cycles are years ahead in point of comfort and suitability for this end of the world.

I hope you will be able to publish this, as Australians much prefer buying an English article when they get their money's worth, to say nothing of their having to pay less duty, and it may be the means of persuading the makers at home to send out machines worth having. DOWN SOUTH.

Melbourne.

Transmission with Sidecar Attachments.

[3337.]—Upon receipt of the weekly copy of your paper, I turn as a rule first to "Occasional Comments," by "Ixion." I read that page with grateful appreciation, and I may add with appetite whetted for more. But such expressions of such an authoritative expert in the issue of April 8th as to the "essential requisites for a sidecar that is to be used for genuine touring work" appear to me almost unreasonably sweeping. They may, besides, have the effect of causing many who wish to enhance their pleasure by sharing it with a passenger to give up all idea of a sidecar as impracticable. Practical experience last year and this of a 6 h.p. twin N.S.U. fitted with N.S.U. two-speed gear and Mills-Fulford sidecar assures me that "belt drivers" who possess 4 to 6 h.p. twins need not wait for that indefinite future when "Ixion's" ideal shall actualise. They can at once go ahead in easy confidence.

I have driven the above combination on tour and on long journeys, and have by no means spared it. My passenger has on not a few occasions weighed twelve stones. I scale eleven stones. The machine has never yet failed me on a hill through want of power or efficiency of the drive. It has been twice through the Quarterly Trials. My stoppage on Amersham Hill in last trials was due to frozen carburetter. The low speed has seldom to be called upon. The two-speed gear on my mount has done its 8,200 miles, and has so far been equally reliable with the rest of the machine. This type of gear has the double advantage of being comparatively inexpensive to purchase, and can be fitted to any existing machine of the belt type as easily as an ordinary engine pulley, and without incurring the aggravating cost of alteration to the machine itself. After experiences with both chain and belt drives with passenger attachments, I unhesitatingly declare in favour of the latter.

The important thing it seems to me is to have your belt of sufficiently large cross section. Mine is $1\frac{3}{8}$ Continental, and is still in use after 7,000 miles. It would be interesting if "Ixion" would say why belts of 1¼in. or 1⅜in. should not be used with 5 or 6 h.p. Surely they would last longer and be more efficient.

The mileage I plead guilty to may appear somewhat small to constitute an adequate test, but inasmuch as I drive through all weathers, and on all conditions of roads, my experiences may not be altogether devoid of value to others.

(Rev.) E. W. HASWELL.

Police Methods.

[3338.]—On the 17th inst. I arrived at the Red Lion, Hatfield, from London, riding directly there in the company of two friends about 11.10 a.m. There were a number of motor cyclists in the hotel yard, and many continued every few moments to arrive.

I had been there with my friends and acquaintances fully thirty minutes when a police officer came on the scene and approached me, asked me to show him my license, which I immediately gave him; he asked me to show him my machine, and he then put down the number in his book. The constable then amazed me by saying he should proceed against me for riding to the common danger round the bend leading off the bridge (Welwyn side) into Hatfield at forty miles per hour, and further stated that I had only just come into the yard, and he could identify me by my white Holland jacket. He would not listen to me when I told him he was mistaken, and retorted "He knew all about that," and left the yard and resumed his position.

I appealed to my friends who saw me come in now over half an hour previous, and about twenty declared their intentions of supporting me. Thereupon I ventured to go across to the constable and tell him he had made a mistake, and asked him to return and make further enquiries of all in the yard while I stayed at his post. Very unwillingly he consented, and after fifteen minutes' examination of those present, and a score of assurances of his blunder, the intelligent officer said he would give me the benefit of the doubt, but it was a man in a white coat.

I was one among seven other white-jacketed motor cyclists in the yard. I had not passed the bridge, my halt at the Red Lion being about 200 to 400 yards on the London side of it thirty minutes before the alleged offence. The constable did not take the offending motor cyclist's number, and instead of honest admission of his mistake and discreet apology, got out by giving an innocent man the benefit of the doubt, and stating, "If it wasn't you it was someone else in a WHITE COAT."

Air Cooling.

[3339.]—In reply to "Scotia," it is very easy to say that an engine is inefficient, and it is very difficult to prove that it is not. Because motor cycle engines are normally run at speeds that propel the machine at about twenty-five or thirty miles per hour (giving, in the case of the average 3½ h.p. engine, as he says about 2 h.p.), therefore the engine is inefficient because it is not running at the 2,000 r.p.m. or so at which it gives its maximum horse-power, and he reasons that it is waste of money to use a powerful engine.

The ordinary motor cyclist does not want the mechanical or thermal efficiency cast in figures on the crankcase; he wants an engine that pulls to its last gasp, as it were, and will run slow and fast without unnecessary vibration. The key to my argument is, curiously enough, to be found in another part of the same issue, viz., in the article on page 397, entitled "Touring Machines—The Weight Question." The writer says, "Leaving out the question of speed, my answer to this, and I think most old motor cyclists will agree, is that the lightweight as a touring motor cycle lacks the comfort of the heavier machine." And why? Because, apart from the lightness of the frame and tyres, the speeds of the machines being equal, the small engine is running faster than the big one. A really well-designed single-cylinder engine gives beautifully smooth running with a 4½ or 4-1 gear at twenty-five miles per hour, above that, road and latterly engine vibration begin to be felt. I started motor cycling on a 2 h.p. machine, but the engine had to run so fast to do thirty miles an hour that I felt it was too cruel. I am waiting for the two-stroke engine. B. T. U.

Knocking in Motor Cycle Engines.

[3340.]—The problem of knocking in motor cycle engines appears to be one which has received very little attention; engines vary very much in this respect, and the pleasure to be derived from riding a motor cycle depends largely, to my mind, upon whether the engine is addicted to knocking.

By knocking I do not mean only the loud clanking which occurs in an engine when the machine is on a hill that is too much for it, but also include the peculiarly harsh sort of half-clanking explosion which some engines are never free from when travelling on an up grade. To anyone who has ever ridden over an engine free from this, and who takes any notice of the sounds proceeding from the engine at all, riding with an engine which suffers from the defect mentioned above is an agony.

The point, however, which is so puzzling to my mind is, What is it that causes it, and why is it absent in some engines? It is not loose bushes, as I have a twin engine which, through some soft metal having crept in—accidentally, in all probability—has considerable play in the connecting rod bushes, both big and little ends; yet this engine never knocks, and the explosions are always sweet and elastic. If driven up a hill that is too much for it, it makes a struggling sort of noise, but this has not the slightest resemblance to a knock. If driven up hill with the spark advanced too far, it merely goes slower than it would if the spark setting were correct. Of course, if the spark were brutally too far advanced it might knock, but I have not tried it and do not intend to. On the other hand, I have driven engines which were hushed up quite tight all over which have knocked at the slightest provocation, and the great majority of engines will do more or less. No doubt some readers will say they have an engine which does not knock, but unless they have ridden over one that is really perfect in this respect they probably do not know what it is to be free from it. I met a man recently who said he did not know what a knock was like, but on going for a ride with him every explosion was an awful clank to me. I left him in blissful ignorance.

Whether it is the design of the cylinder head, or the compression ratio, or what it is, I do not know, but probably your staff, in riding different machines, will have noticed what I allude to. A. C. HUSKINSON.

[The majority of motor cycle engines are designed with as high a compression as they will reasonably stand without preigniting at normal speeds. Doubtless, when the compression space is reduced slightly by the addition of a cake of burnt oil on the piston and combustion head, preignition will occur earlier; but it is almost certain to occur if gear ratio is too high, or speed has fallen too low.—ED.]

Unattached Riders.

[3341.]—I notice in your issue of May 13th a letter signed Harry A. Bullock, commenting upon the facilities offered by the Auto Cycle Union, and comparing them to the advantages to be secured by subscription to the Cyclists' Touring Club, and note that he considers the latter far preferable to the former.

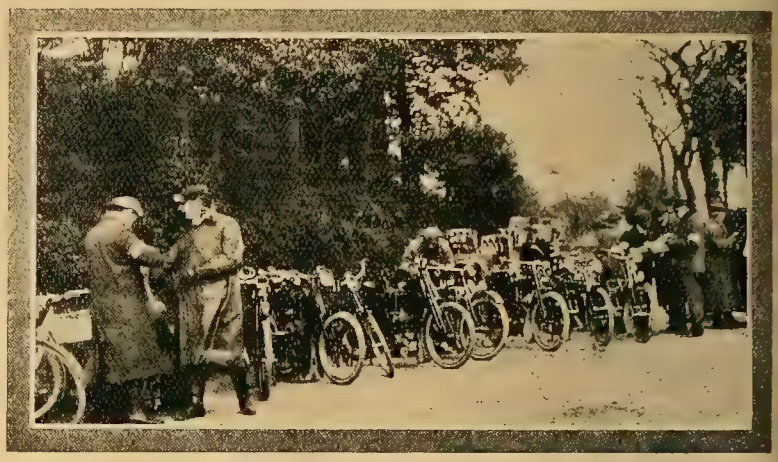
I am surprised to think that a reader of your paper should be so unenlightened as to imagine that the C.T.C. can offer for its subscription of 5s. anything like the privileges that the A.C.U. can give for its half-guinea subscription.

One has only to consider that the A.C.U. can give full privileges of associate membership of the Royal Automobile Club, which includes the use of club rooms at 112, Piccadilly, a weekly copy of the *Royal Automobile Club Journal*, legal advice, special touring facilities, in conjunction with access to the best organised touring bureau of the country, and many other valuable advantages of direct benefit to motor cyclists, and then to consider that all the C.T.C. can really offer, in addition to touring facilities, is the *Monthly Gazette* and a reduction on hotel bills.

If Mr. Bullock will only write to the secretary of the A.C.U., at 18, Down Street, W., I feel sure that he will soon alter his opinions concerning the Auto Cycle Union.

H. GILLARD COVE.

[3342.]—In a recent issue dealing with this question you mention the fact that "for every local motorist who associates with the R.A.C. direct the local club, if affiliated, receives a portion of the subscription paid to the R.A.C. by the local associate." At the time I thought it would be much simpler if the local clubs enrolled associate members at a five shillings subscription and then affiliated them to the A.C.U. This, I see, is now being done by at least two clubs—the Bradford M.C.C. and the S.E. Auto Cycle Association. The latter association, the hon. sec. of which is Mr. H. B. Renner, 31, Kidbrook Park Road, Blackheath, S.E., being near my own district, I have now joined.



Great Yarmouth and District M.C.C. members assembling at Haddiscoe for the penalty run over a distance of seventy-six miles.

With regard to the privileges the A.C.U. should grant to its own associate members, I must say that on this I do not agree with you. I think that it should grant all the privileges that it grants to the members of affiliated clubs, a list of which were given in your issue of February 12th. Could you not repeat this list to show motor cyclists the advantages they obtain by joining a club which affiliates its members to the A.C.U.? J. H. S.

Air Cooling.

[3343.]—It would be interesting to hear if any motor cycle engine has been designed or built on the lines of the air-cooled engines on certain American cars, with a cylinder covering and "air circulation" by means of an enclosed fan driven off the crankshaft.

These American cars can hardly be looked upon as freaks, and one with a powerful four-cylinder engine is about to be raced at Brooklands. There appears good scope for inventors for an engine on the lines mentioned. D 1617.

[Several motor cycle engines have been designed on these lines—one with a spiral air chamber.—ED.]

SUMMARY OF CORRESPONDENCE.

Mills and Fulford, Coventry, write: "We notice in last week's issue of *The Motor Cycle*, page 396, 'Hints and Tips for Motor Cyclists,' by 'Road Rider,' that in tip No. 214 it is stated under the heading of 'Sidecars' that the rigid pattern alone is entirely free from side-slip. We would like to point out that the castor wheel model is equally as free from side-slip. This will be perfectly clear when we point out that the steering castor head is fixed in a perpendicular position, so that, no matter at what angle the wheel may be, the level of the car remains the same. Although a motor bicycle fitted with this pattern of sidecar will under severe conditions slip slightly, it is impossible for any serious complications to ensue. With our latest pattern of clips, our sidecar can be attached and detached in a couple of minutes."

Mr. B. H. Davies requests us to state that from this date his address will be 11, St. George's Avenue, Northampton.

EXPERIENCES WANTED.

"J. H. S.," Glasgow, would like readers' experiences of the 4½ h.p. F.N., particularly with regard to economy in petrol and oil, vibration, upkeep, and starting.

"GOODRICH"!

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE.

Owing to the Holidays, Advertisements for our issue of the 10th June must reach Coventry not later than FIRST POST on Thursday, 4th June, to ensure insertion.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

MOTOR BICYCLES FOR SALE.

3½ h.p. Chater-Lea, Longuemare, Nilmelior trembler, new Prested, heavy tyres, Continental back with Bates band, Watawata, Price's stands, long bars; £16 16s.; good machine; too powerful for young rider.—"The Rowans," 8, St. John's Road, Brixton.

FOR Sale, Motosacoche, quite new, not ridden yet, Druid spring forks, Palmer tyres, N.A.B. seat-pillar; cost £36, including £1 spares; garaged at Earl's Court Garage, Earl's Court Station; take £27, or exchange for 4 h.p. Roc, if in faultless condition. — Write, Motorist, Flat F, 22, Redcliffe Square, S.W.

6 h.p. Bat, Jap spring frame and forks, special brakes, Jap lubricator, Autoclipse lamp, two new belts, studded tyres, perfect condition, full kit tools and spares, not done 2,000 miles; owner bought car; £30. —Humphrys, 6, Comberton Terrace Kidderminster.

3½ h.p. Quadrant, 1906 pattern, but very little used, and as new, enamel and plating perfect, spring forks, tyres unscratched, very fast, and splendid hill-climber, with all spares, stand, etc.; price £20, no offers.—G.G., 34, Cambridge Place, Paddington, W.

FULL of all the good qualities necessary to make a perfect motor cycle is the four-cylinder F.N., not a machine to go 90 miles an hour, and —— but goes comfortably all the time, whether it be 4 or 40.—For particulars, trials, etc., write F. Heath, Salford Priors, Evesham.

MINERVA and Rex. — We carry the largest stock of spare parts in the provinces for these machines, can deliver new machines from stock at low prices; cash, exchange, or gradual payments; charged accumulators for hire, 1s. per week.—Cookson Bros., 511, Chester Road, Old Trafford.

KERRY, 2¾ h.p., Model de Luxe, in new condition and order, Continental tyres, long handle-bars, low saddle, new P. and R. accumulator, Lycett belt and toolbag, complete with all high-class accessories, very fast and reliable; a bargain, £13 10s.; after 6 p.m.—30, Willow Road, Hampstead, N.W.

1907 5 h.p. Twin Magneto Rex, cantilever seat, Albion adjustable pulley, Wright's spring footrests, Rich's tubes, Michelin non-skid back, Bradbury stand, Main-Hilton carrier, many spares, condition perfect, ridden 500 miles; lowest £26 10s.—E. Buttle, Woldingham. Garaged at Wauchope's.

3 h.p. Fafnir, Chater-Lea, low, excellent condition, just overhauled, fast, reliable, good climber, new back cover and tube, re-treaded front, two-way switch, trembler coil, hooter, stand, Brooks B100 saddle, tool-bag, numbers, all spares, etc.; removal sole cause of selling; price £12 10s.—Dr. Freeman, Earlsfield, S.W.

1908 Triumph, in perfect condition, only two months in use, has not given a moment's trouble hitherto, and fairly laughs at hills, handle-bar control, adjustable pulley, magneto ignition; cost, with accessories and touring kit, £54, price for immediate cash, £39.—Box No. 9,927, *The Motor Cycle* Offices, Coventry.

3½ h.p. Fafnir, two speeds, Longuemare, fitted Gillett-Leechman, Chater-Lea throughout, No. 6 frame, tricar hub, spring forks, Brooks B100, 2½in. Palmer cords, unpunctured, two accumulators, brass torpedo tank, thumbslides, footboards, chain drive, low, faultless; £25.—Thompson, 112, Hatfield Road, St. Albans.

Unattached Riders.

THE article published in these columns under the above heading does not appear to have been absolutely correct. We stated that the committee of the A.C.U. had decided to organise a scheme of association for unattached riders at 5s. per head. This statement was made on the strength of a proposition, duly seconded and carried, that the question be referred to the Relations Sub-committee. We naturally took this as a commencement, and were surprised to hear indirectly that the A.C.U. Committee has no intention of doing anything for unattached riders except at the ordinary fees of 10s. 6d. for provincial and £1 for town riders, which includes certain advantages which we do not think are required by the majority of riders.

At the same time, two or three provincial clubs, notably the S.E. Auto Cycle Association and the Bradford M.C.C., have not been loth to take advantage of this apparent apathy, and have decided to attach riders who are called associate members to distinguish them from full members. Associates pay 5s. subscription and an entrance fee of 2s. 6d., which includes affiliation to the A.C.U. and association with the R.A.C., full benefits of the Legal and Touring Departments of the A.C.U. and R.A.C., the right to exhibit the distinctive machine badge of the S.E.A.C.A., and representation on the General Committee of the R.A.C. and on the Council and Committee of the A.C.U. through the representatives of the S.E.A.C.A. The Bradford M.C.C. scheme is on the same lines.

Now the first question one naturally asks is, if it pays local clubs to give unattached riders certain benefits at a reduced fee, why should it not also be possible for the A.C.U. to do it, and why does the A.C.U. give unattached riders these benefits for 2s. when affiliated indirectly, and refuse to do so directly? In other words, the A.C.U. takes 2s. only for each associate, and allows the local or provincial body to retain the remaining 3s. True, the local club can influence unattached riders, but in our opinion for one who would join a small provincial body, fifty would associate themselves direct with the head organisation at the same fee. Can any influential member of the A.C.U. Committee enlighten us on the wisdom and policy of the above schemes? We have heard many statements regarding them, but no authoritative explanation beyond a semi-private communication that the A.C.U. did not intend to give something for nothing. Yet it is willing to accept from local clubs a fee of 2s. for doing work which it says cannot be done for 5s. if paid direct into its coffers by unattached riders. We have supported the A.C.U. through thick and thin, but we must say that the present policy is a weak one, for the simple reason that there is nothing to prevent a body like the S.E.A.C.A. eventually becoming a sufficiently powerful appendage to sway the body of the canine known as the A.C.U.

Motor Cycles at Brooklands.

THE majority of our readers will have seen in the daily press accounts of the action taken by a resident at Weybridge against Mr. Locke-King, the proprietor of Brooklands Track. Mr. King, unfortunately, lost his case, and has had in consequence to pay heavily for damages. We are indeed sorry for two reasons—firstly, for Mr. Locke-

King, whose disappointment has been considerable, the blow being a really cruel one, coming as it does at the beginning of the racing season; and, secondly, for motor cycling, since the result of the judge's decision has been to make the Brooklands authorities doubly careful to stop all unnecessary noise, and, bearing this in mind, they have decided to suspend motor cycle racing for the present. This is indeed hard, as Brooklands has been of much use to the movement, and would have been more later on, when motor cycle racing there had been developed further, since it is probably the safest track in England for a machine fitted with any sized engine travelling at any speed. We feel almost inclined to think that the motor cycle has been made a scapegoat for the sins of the powerful racing car. That it is noisy, no one can deny, but that it is as offensive to the *profanum vulgus* as its larger *confrère* is hard to believe. But the matter does not end here. The motor cycle has the reputation of being noisy, and on the principle that a dog with a bad name is better suspended than living, so this evil reputation has resulted in the temporary suspension of motor cycle racing at Brooklands.

Now, who is to blame? Brooklands? We must not be too hasty. Brooklands has been guilty of many errors, and these it is hastening to rectify, and probably when it has got over its scare and considered the matter calmly, we shall see motor cycle racing reinstated at Brooklands. No, we fear it is the inconsiderate member of the motor cycling community who rides through populous places either without a silencer, or with one and without using it, who is as much to blame as anyone for bringing this bad name upon motor bicycles, and if the A.A. is anxious to carry out its work of reforming the inconsiderate driver by means of its newly-formed Committee of Public Safety, it should report all cases of ultra-noisy motor bicycles and cars to headquarters. However, this is rather beside the point. The sad news about Brooklands we learnt in the early part of the week from Mr. Rodakowski himself, and on our suggesting that motor cycles fitted with effective silencers should compete, he replied that the trial was not worth the risk. The result is that the race open to naval officers at Whitsun is cancelled. There is no doubt that the Brooklands authorities are badly scared, but the sooner they recover and treat the motor cycling side of motor racing in a calm and sensible manner the better will motor cyclists be pleased. There is no doubt that motor cycle racing drew a considerable crowd to the track. Probably a simple way out of the difficulty would be found if a joint committee of the A.C.U. and B.A.R.C. were formed.

Start of the three miles race at the *Sport and Play* meeting at Birmingham, May 23rd. C. R. Collier v. H. V. Colver. C. R. Collier, the winner, is on the left.

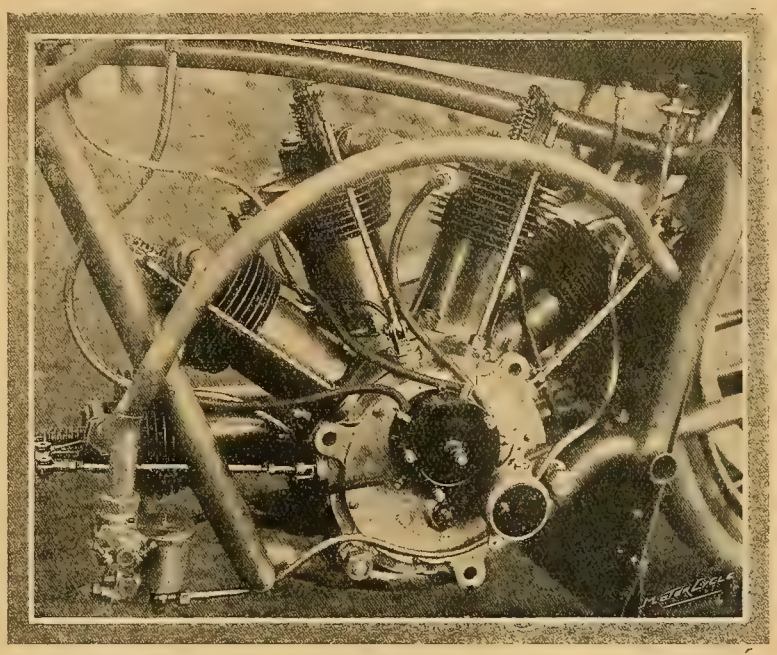
North Wales is an interesting touring ground for motor cyclists, and is probably the most popular with that vast population inhabitating the counties of Lancashire, Cheshire, and Yorkshire. A handy little guide to North Wales is "Throup's Cyclists' and Motorists' Guide," price 6d. nett. A copy of this has just reached us, and it contains a considerable amount of useful information with a good map and route distances. It is published by T. Throup, publisher, Bradford. Another handy little booklet is Throup's index marks, speed tables, lighting up tables, and main roads guide. It is priced at 1d. only.

A Goodrich all rubber non-skid tyre on the back wheel of a 3½ h.p. machine we have in use has not been touched with the pump in seven hundred miles' running. As regards wear, the tread is now rather thin, but the studs at the sides of the tread are still as good as new. In grease, the studs when new are a most effective preventive against side-slip, and we have not found the tyre slow the machine on the flat or in hill-climbing. The cover we are using is of 2¼in. section, but all sizes can be obtained, and the makers also undertake to fit these rubber studded bands to existing tyres. The makers are the B. F. Goodrich Co., 7, Snow Hill, E.C.

A Five-cylindered Motor Bicycle.

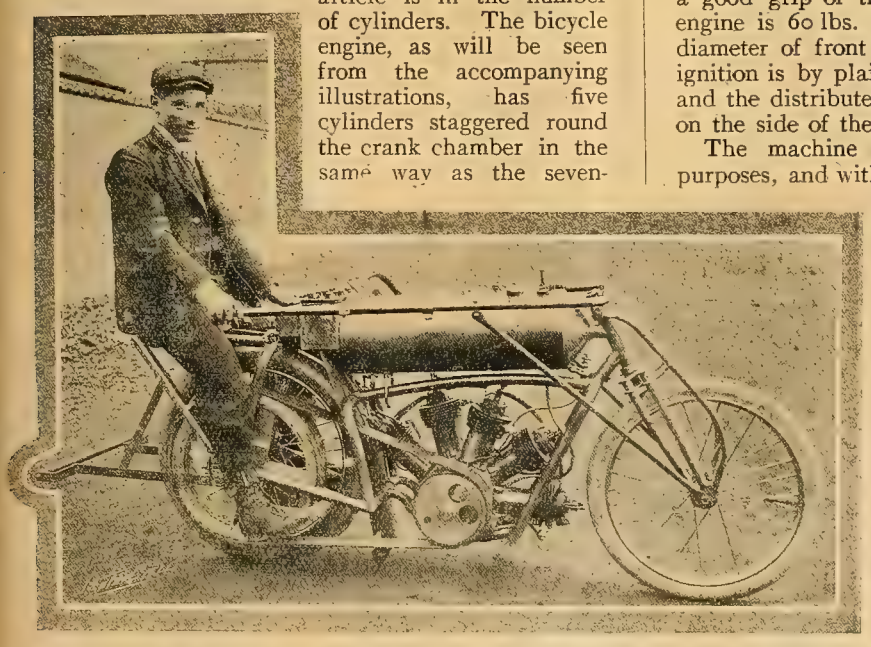
ON January 15th there appeared in *The Motor Cycle*, page 56, sectional line drawings of the lightest petrol engine for its power which has ever been constructed. The name of this engine, as readers may remember, is the Esnault-Pelterie, designed and built in France for aerial navigation. The engine has several very distinguishing and clever features, principal among which may be mentioned the method of attaching the connecting rods to the crankshaft. The valves are situated in the top of the combustion head, and the inlet and exhaust valves are combined.

We reproduce herewith an illustration in section of the valve arrangement, as without it it would be difficult to understand the method of operating the valves and distributing the inlet and exhaust gases. The line drawing shows the exhaust slide valve A seated. When the slide valve A is opened towards the end of the working stroke, it leaves a free passage for the exhaust gases to escape through the holes B and C directly into the atmosphere. At the end of the exhaust stroke the slide valve A, instead of closing, opens still further, causing the collar D to come to rest against the corner of the angle E, so that air cannot enter *viâ* C and B. When the collar D is at rest, the inlet holes F are open, and there is direct communication between the carburetter and the cylinder *viâ* the holes H and F. The only practical difference between the seven-cylindered engine constructed for propelling an aeroplane and the five-cylindered motor bicycle engine which is the subject of the present article is in the number of cylinders. The bicycle engine, as will be seen from the accompanying illustrations, has five cylinders staggered round the crank chamber in the same way as the seven-cylindered engine. One carburetter serves the whole five cylinders, whereas in the seven-cylindered engine there is one carburetter for each group of cylinders. It will be noticed that the designer of the motor bicycle has cleverly utilised the space occupied by the crank case, and has dished a large flat-faced engine pulley over it. The back belt rim is of wood with wooden arms, and should allow the flat belt to obtain a good grip of the pulley face. The weight of the engine is 60 lbs. only, length of wheelbase 3ft. 5in., diameter of front wheel 28in., rear wheel 30in. The ignition is by plain coil and make and break contact, and the distributer is the larger of the two cases seen on the side of the crank case in the top picture.

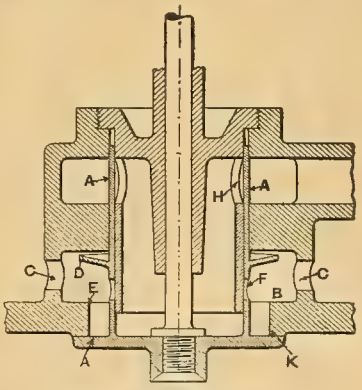


The lightest engine for its power yet constructed for a motor bicycle. The carburetter fitted is a Claudel.

The machine is, of course, intended for pacing purposes, and with its aid a French cyclist (Gombault, paced by Coutant) hopes to beat the record by covering 100 kilometres within the hour.



The 20 h.p. five-cylindered Esnault-Pelterie engine fitted to a pacing machine. The total weight is 330 lbs.



The valve arrangement.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(*Continued from page 416.*)

OTHER POINTS IN ENGINE TUNING.

1. Sufficient lubrication as to quantity and quality of oil.
2. Absence of wear in all moving parts.
3. Large, straight exhaust pipe, leading to silencer, having large vent holes and well perforated partitions unchoked by dirt.
4. Cleanliness of piston head and combustion chamber.
5. Cleanliness of radiating fins; or if a water-cooled engine, perfect cleanliness and working of cooling system.

THE CARBURETTER.

Must be (a) clean and (b) properly adjusted.

Cleanliness is easily verified.

Adjustment is a matter on which no absolute laws can be laid down. See previous hints with reference to setting petrol level to avoid flooding. It then remains to see if jet is of correct size, and if sufficient air is admitted.

W. G. Ross, one of the Cambridge University M.C.C. team, in the competition with the Cambridgeshire M.C.C. on the 23rd ult.

If you want maximum power, and the engine will stand it without running hot, use a jet of 1-32in. bore, or a 10 jet Longuemare on all motor cycle engines. Most engines then require a choke tube of about twenty-four millimetres diameter—this choke tube controls the amount of air admitted below the jet. It then remains to set the air admitted above the jet. This will be about right, if at top speed on the hottest days the engine will *just* take all the extra air you can give, *and no more.* But I do not know a single carburetter which, as sent out, affords sufficient "top" air for a twin-cylinder cycle engine, and with practically all such engines, it will pay to add an air slide to the inlet pipe.

In cleaning the carburetter do not omit to brush all gauzes, whether internal or external, with petrol.

THE IGNITION.

In tuning the ignition, as with everything else, the first point is to see that everything is scrupulously clean. All connections must be clean and bright, all contacts smooth, and in true register, all wiring intact, as short as possible, and all thin strands twisted together. The plug points should be 1-32in. apart for coil ignition, and the makers say .4 of a millimetre for high tension magneto.

With a high tension magneto see fibre ring is intact, and timing correct; detach and clean contact maker, and wipe brass face at rear of it. Detach oval plate above contact maker, and wipe fibre washer behind it. Paint over switch screw, washers, and carrier with shellac to avoid dirt affecting them. See if fibre washer surrounding carrier of fixed platinum on contact breaker is intact; wash out oil reservoirs with paraffin, and refill. Clean exterior of contact breaker, and especially contact point of flat spring. Clean ends of brushes on high tension terminals, unscrewing them gingerly, as they are brittle.

With accumulator ignition see that cells register a full four volts. See that earth from contact breaker is not made by an oily shaft, and if it is, carry a short extra wire to engine for it, or put two or three coils of an old weak inlet valve spring on the shaft behind the cam—this has a very good effect. If a wipe contact, clean, and see that the circumference of wiping surface is true, and that wiper is bearing strongly against it. Verify timing. Adjust contacts by running engine on stand, with a heavy friend in saddle; the adjustment which permits of the highest engine speed, and yet allows engine to start readily, is right. If a trembler coil is used with make and break contact, test all four contacts in this way. If a twin-cylinder engine is used, first adjust one cylinder to run its fastest, and then adjust the other cylinder till it runs at the same speed. Verify by shorting one sparking plug with a screwdriver provided with a wood handle, or depressing its inlet valve.

TYRES.

The tyres should be inflated hard without being so hard that they cause excessive vibration. The degree of inflation depends on rider's weight. Thick treads slow the machine a great deal, but it is advisable to order tyres well up to the work.

WIRING.

222. The longer and the thinner the wiring, the greater its resistance. Use, therefore, short, thick wires, with many strands, as they are less liable to fracture.

III. Troubles.

TRACING TROUBLE.

223. An intelligent motor cyclist will almost always know why his engine is misfiring or has stopped altogether before he has dismounted, and it is astonishing how soon this facility is acquired. Let us, however, suppose that the rider is a complete novice, that his engine has stopped, and that he has not the maziest glimmering of the reason. Make sure—

1. That there is petrol in the tank.
2. That the switch is on.
3. That the levers are set accurately for running.

Having thus eliminated sheer personal carelessness, let him discover in which department of his propelling mechanism the fault lies.

1. Detach thick wire to sparking plug, hold it ¼in. from end of plug, and with switch on, make and break contact at contact breaker on engine. If no spark the fault is electrical. (Be careful to hold wire only by rubber.) See previous paragraphs for testing high tension magnetos.

2. If there is a good spark, see if petrol is reaching the carburetter. See tap is open, and joggle float needle up and down; if petrol flows out of bottom of spray chamber the supply is probably all right.

3. If gas supply and ignition of it are right, something must be amiss with the engine; therefore push machine with valve lifter dropped, and see if back wheel skids, revealing good compression. If m.o.v., see both are working; if a.o.i.v., press it down, and notice that it is not gummy.

The above simple tests will immediately reveal the nature of any ordinary derangements, and having performed them, the rider can proceed to test either the ignition, or the carburetter, or the engine, for other faults which will be enumerated later.

A competitor in the Sunderland and District M.C.C Hill-climb at Tunstall Hope.

How We Climbed Sutton Bank.

WHEN I saw the announcement in *The Motor Cycle* of the A.C.U. climb up Sutton Bank, it brought to my mind the time when my brother and I "climbed" the hill. Several articles have been written describing this notorious hill, but, unfortunately for us, none of them appeared until after we had made the attempt, or we should never have had the audacity to attempt to scale its heights on a single-geared 3½ h.p. bicycle and sidecar.

We had arranged to take a run from Scarborough to Richmond and back, and set out on a Whit-Monday morning with every prospect of having a grand time. The weather was fine and the motor in grand trim, so for the first twenty miles to Malton we hummed along merrily. Here, however, we had to pick our way slowly amongst gaily-decorated farm horses, which were evidently gathering up for a show, and they seemed to have a dislike for motors. We, however, emerged safely, and were soon clear away on the road to York. Not far beyond Malton we encountered one or two rather stiff hills, and up one of these our little engine refused to take the full load, so we had to dismount, and as it was too steep to make another start we had to push. Whilst enjoying this exercise we discovered that we were in a police trap, but all fear of receiving a summons was banished from our minds by the assurance of the man in blue that we were well within the legal limit.

We Miss Our Way.

We made short work of the next twenty miles to York, but here our troubles began. We got into the city all right, but could not find our way out, for, after making careful enquiries as to which road to take, we found, after travelling about a mile, that we were on the road to Tadcaster. We retraced our path, and made further enquiries; this time we were sure we were on the right road. However, about three miles out, we saw a signpost "11 Miles to Wetherby." Once more we returned to York, and at the third attempt succeeded in finding the right road. The surface being excellent, we made up for lost time, and kept up an average well over the limit to Boroughbridge, where we stopped for a little refreshment, and then on again towards Richmond. Passing through a small village we saw a sign "Motor Spirit," and as our supply was getting rather low we stopped to fill up, and on asking the price were told 1s. 10d. a gallon! Under the circumstances, we contented ourselves with half a gallon. As we neared Richmond, the roads showed signs of recent heavy rain, although we only encountered one short shower.

Arriving safely at our destination, we found the whole of the quaint old town in the possession of cyclists, there being a big club meet on the way, and we had great difficulty in finding a place to put up for the night. Eventually room was found for us at a little temperance hotel, and after tea we set off to explore the beauties of the dale, on the side of which the town is built. Rain, however, commenced falling, and we were soon glad to get back to supper and bed.

Muddy Roads on the Return Journey.

Next morning the rain had not ceased, so we abandoned the idea of an early start, and spent the morning tinkering with the motor. Our worthy landlord was meanwhile regaling us with funny stories about a Scotch motorist who had stayed at his hotel, and who seems to have spent the greater part of his time mending punctures, or rather attempting to do so. His mode of procedure was to put on about half a tube of solution, dab the patch on quick, stand on it for a quarter of an hour, and then wonder why it would curl up when he took his foot off.

The rain showing no signs of abating, we decided to make a start, and, despite the frightfully muddy roads, we were soon speeding merrily along. After the first few miles, however, the wet and mud began to tell on the belt, and at each rise we got a most effective free engine; but, worse than this, a strange noise began to develop, apparently in the engine. As it did not affect its running, we kept on for some time; but it got gradually worse, so we decided to dismount and try to find out what was wrong. Try as we would, we could not locate it; first it seemed to come from the valves, then the magneto, then somewhere else, so after putting oil on every available part we gave it up.

An Evil Impulse.

As we had stopped I thought I would tighten the belt, and while thus employed some evil impulse possessed my brother to study his map, and he made

The North West London M.C.C. Run to Coventry and Back. No. 11—C. J. Burton (3½ h.p. Vindec and sidecar) ready to start on the return journey.

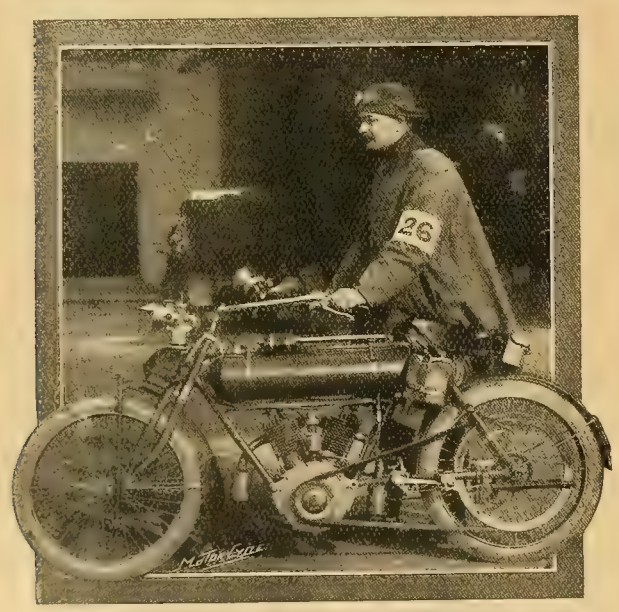
the discovery that if we turned to the left a few miles further on and passed through Thirsk and over the Hambleton Hills we should cut off about thirty miles. With visions of something wrong inside the engine, we were only too glad of a short cut home, but if we had known what was before us I think we would gladly have gone fifty miles round. We had heard of Sutton Bank, but thought it only a short steep hill, and we said we could easily push the machine up if it refused to climb it.

How We Climbed Sutton Bank.—

On restarting, the engine pulled beautifully, but the mysterious noise still continuing made us feel anything but comfortable. We were quite convinced that at least the gudgeon pin screw had come out and was grinding itself to pieces among the flywheels. After passing through Thirsk we noticed the strange noise was dying away as gradually as it had commenced, and soon we found ourselves in the little village of Sutton. We were blissfully unconscious of what was in store for us. Having covered nearly thirty miles of very muddy roads, the machine was by this time pretty well coated with mud, and the free-wheel had become free both ways, which made it impossible to give any help with the pedals.

The Bank in Sight.

When we came in sight of the hill our hearts began to sink. Only those who have been there and seen for themselves can fully appreciate our feelings; but the worst is not seen from the bottom, or I think, even though we had ridden so far, we should have felt inclined to turn back. As it was, with the empty sidecar and a cool engine, I made a rush for the hill, but I did not get far, the pedalling clutch still refusing



E. W. Ashworth, who won a silver cup in the North West London M.C.C. Twelve Hours' Run to Coventry and Back on May 23rd. The machine is a 7-8 h.p. Ardennes model Minerva.

to act, in spite of liberal doses of paraffin and oil administered at the bottom of the hill. When the engine slowed down there was nothing for it but to let it stop, and to jam on the brakes to prevent a hurried descent (backwards). Then commenced the climb proper. By this time the clouds had cleared away and the sun was shining. It seemed to us hotter than it had ever been before, so off came our waterproof coats and overalls, and we started to push in earnest. We progressed very well at first, but when we came to the 1 in 4 portion we had to divest ourselves of more superfluous clothing, and then push for all we were worth; but even then every few yards we had to stop, put a stone which we were carrying for the purpose behind the wheel, and rest. Whilst we were resting on the steepest part of the hill a large car passed us going down with its brakes so tight on that both back wheels were locked, and it was simply sliding down the hill.

Once we had passed the steepest part we were soon at the corner, only to find stretching away before us as far as we could see more hill almost as bad as what we had just come up. The surface of the road was so poor that it was difficult to get a foothold, but we bravely started on the second part of the climb. We soon found out, however, that pushing a motor bicycle scaling over 160 lbs. and a sidecar in addition had a tendency to make one feel tired. So once more we sat down to rest, and were just expressing a wish that a traction engine would come along and give us a tow up when round the corner appeared a pony and trap. Our spirits began to rise. If only we could harness that pony to the front of our bicycle; but no, our dignity would not allow that, so we started off again. It was no use; we were soon overtaken, and the owner of the pony, evidently touched with compassion for two poor motor cyclists, offered to take us in tow. After he had assured us that he had towed up many a motor bicyclist before, we were only too pleased to accept his offer.

Reduced to One Actual Horse-power.

He took off the reins, and we hitched our machine behind the trap with them. Talk about 3½ h.p., that pony simply gave a wink, put his tongue into the corner of his mouth, and with a contemptible sniff set off and pulled the trap, motor, and sidecar up to the top. What a relief to us, and what a view met our gaze when we eventually reached the top. Stretching away for miles around lay magnificent country; such a sight could only be gained from the very top of the hill. Of one thing I am certain; I would not attempt the Sutton Bank climb again with a single geared machine and sidecar, lovely as the view is, unless I knew there would be a pony at the bottom to assist us.

All the way we had cheered one another with the thought that from the top there was five miles all downhill to Helmsley, so after a splendid tea at the Hambleton Hotel we set off again. We had, however, been told at the hotel not to take the road shown on the map, or we should have another bad hill to climb near Rievaulx, but to keep to the top of the hills, and we should have level road for about three miles, and then a gentle down slope right to Helmsley. We took the advice, and for about a mile all went well; afterwards the road began to deteriorate into a second-grade cart track, with ruts three or four inches deep, and the whole of the surface made frightfully soft by the rain. I had great difficulty in keeping the wheels out of the ruts, but succeeded until about halfway down the hill, when a bit of extra bad road caused the sidecar wheel to slip into the rut, and before we knew where we were we were charging across the grass at the side of the road. Luckily for us there was no ditch, and we pulled up safely close under the hedge. After that we proceeded more carefully to Helmsley, where at last we got back upon decent roads.

From here to Scarborough we had a grand run, covering the thirty-two miles in a little over an hour and a half. And so ended a two days' ride, which had certainly been full of incident, and for the most part very enjoyable.

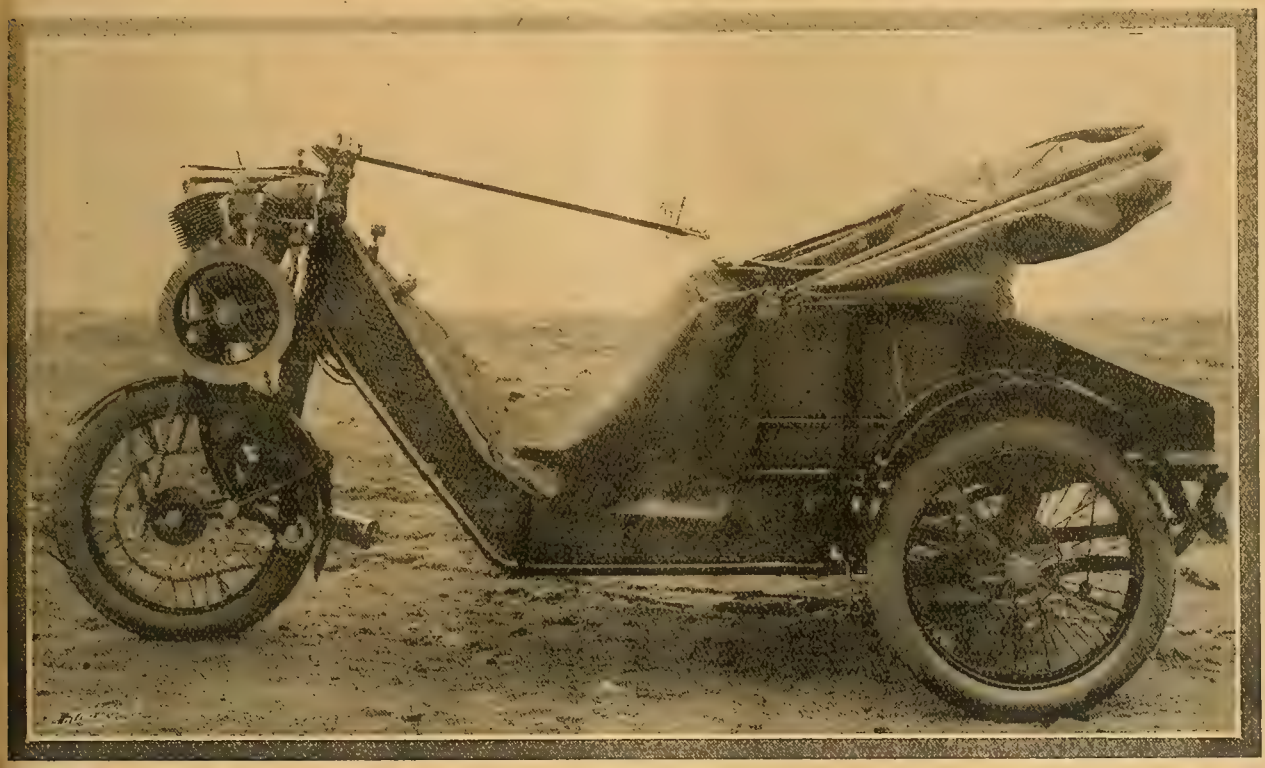
What the mysterious noise in the engine was we have never discovered. AJ 226.

An Interesting Three-wheeled Passenger Vehicle.

A MOST interesting two-seated three-wheeler is the 8 h.p. Phenomobile, sole concessionnaires for which are the New Era Motor Co., 8, Lonsdale Road, West Kilburn. The accompanying illustration shows that the motive power is an h.p. air-cooled engine, the cylinders of which have a bore and stroke of 82 mm. by 84 mm. The flywheel is a heavy rimmed external one, and the transmission is by a single chain running round two jockey pulleys driving the front wheel, the hub of which is the well-known two-speed geared Nala, built specially strong for the purpose. It will also be noticed that the front of the machine, including the engine, is suspended on good spring forks. The carburetter is of the float feed type, and has an extra air shutter, by means of which the air supply can be reduced for starting in cold weather. The lubrication is effected by a drip feed lubricator attached to the steering column. A trigger is situated on the top of the inlet pipes, which depresses two levers, which release the inlet valves should the latter become sticky, or when it is found to be necessary to release the compression for the purpose of turning round the engine. The exhaust, before entering the silencer proper, passes through an expansion chamber, which relieves much of the direct pressure, and causes the engine to run silently. Either magneto or accumulator ignition can be fitted. The forward part of the machine forms the petrol tank, the petrol being delivered by pressure to the carburetter. The handle of the steering tiller forms the change-speed lever, the low speed brake and the clutch of the epicyclic gear being controlled by this means. The spark, air, and throttle levers are also placed at the end of the tiller.

A short run in London traffic gave us a good opportunity of watching the behaviour of the machine, especially its silent running, its flexibility, and good system of springing. In all of the above respects it surprised us agreeably. Machines similar to the above are to be seen running daily in the streets of Berlin.

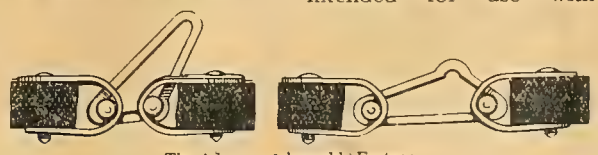
The vehicle we have just described is one of the first to be brought into England, consequently a few alterations in detail may be expected shortly. We noticed that the running of the engine was particularly smooth, the large flywheel being of great assistance in enabling the engine to pick up speed quickly and to run slowly.



The Phenomobile Three-wheeler, with seats side by side, propelled by a twin-cylinder air-cooled engine through a two-speed Nala hub gear.

The two annexed line illustrations of adjustable fasteners are those of the Advance Manufacturing Co., Northampton, and the Stanley Dermatine Motor Belt Co., Bromley, Kent. They are both intended for use with adjustable pulleys, and also provide a quick and handy method of shortening the belt on a long-distance run, without the necessity to use any tools. The sketches are self-explanatory.

The Stanley Adjustable Fastener



The Advance Adjustable Fastene

Land's End to John-o'-Groat's Trial.

THE general arrangements of this trial are well in hand, but we understand from the secretary of the Auto Cycle Union that, although he has already received a number of offers to assist at various places along the route, he still requires a considerable number of helpers. The following is the route to be followed, and he will be glad to hear from motor cyclists residing at or near to any of these places willing to act as honorary checkers, marshals, etc.:

MONDAY, JULY 13TH.

Land's End		Bodmin	57
Penzance	10	Launceston	79
Hayle	17¼	Oakehampton	97½
Camborne	23½	Exeter	120½
Redruth	27	Cullompton	133¼
Zelah	—	Wellington	145¾
Mitchell	40½	Taunton	152½

TUESDAY, JULY 14TH.

Bridgwater	163¼	Worcester	256¾
Highbridge	170½	Kidderminster	271¼
Cross	178	Bridgnorth	284¾
Churchill	183	Wellington	298¾
Bristol	196	Hodnet	309¾
Stone	213	Whitchurch	319¾
Gloucester	230½	Tarporley	333¾

Berriedale	848	John-o'-Groat's	893

Offers of assistance should be sent to the Secretary Auto Cycle Union, 18, Down Street, Piccadilly, W.

We shall publish contour sections of the most difficu portions of the route in our next issue.

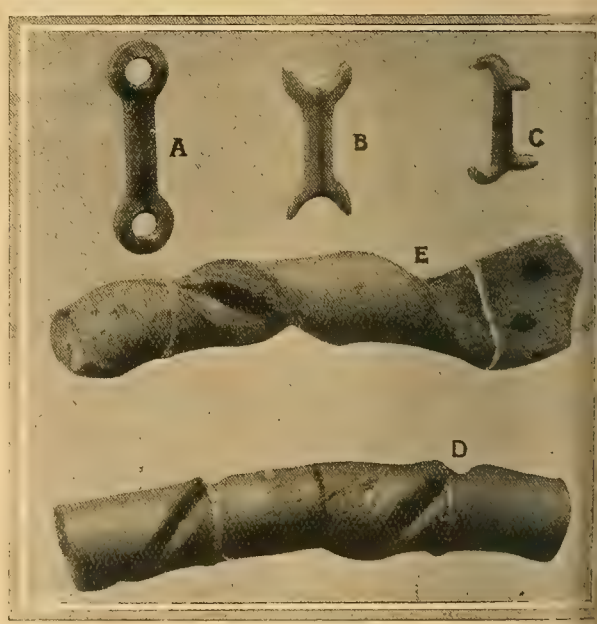
J. A. Prestwich and Co., 1, Landsdowne Road Tottenham, N., inform us that they have registered J.A.P. as a trade mark for all their manufactures.

Fastener for Round Belts.

RIDERS of lightweight machines using round twisted rawhide belts will be interested in the accompanying illustration and description of a fastening for round belts, which was illustrated in *The Autocar* of May 23rd. Mr. W. E. Corcutt, of the Racecourse Garage, Doncaster, who made the fastener, mentions that it is very satisfactory for fan belt drives on cars, but the trouble in making a satisfactory connection for a twisted rawhide belt on a motor bicycle caused him to devise the hook which is the subject of the illustration. Mr. Corcutt says:

"The -shaped connecter is neither neat nor secure, and may be vastly improved upon by what is virtually a grappler ℵ hook, the four points being so turned that the twisting stress in the belt tends to keep the connecter embedded in the belt.

"For a fan belt this grappler hook may be made from a suitable side plate off a cycle chain. The illustrations show the method of making a larger type grappler hook, as aforetime made and used by the writer for motor cycle twisted belts. A is a side plate off an old type 1in. pitch roller chain. B shows it cut across the rivet holes and the four resulting ends opened out somewhat, and all pointed. C shows these four points turned while hot by means of a pair of round-nosed pliers until the device is a double-ended grappler, but the four points must be turned left or right hand, according to whether the belt has a left or right-hand twist. D shows the ends of the belt connected or grappled together. E shows the end of the belt to be connected. It has two small hole punched or pricked through each end, into which hole



the two points of one end of the grappler connecte engage."

DUNLOP

FURTHER SUCCESSES

of Dunlop motor-cycle tyres.

SHARPENHOE HILL-CLIMB,

Saturday, May 2nd, 1908.

Single-cylinder class: Mr. R. M. Brice on a $3\frac{1}{2}$ h.p. Brown, fitted with Dunlops,

FIRST,

making

FASTEST TIME

in class.

The fastest time of the meeting, which was made on a twin-cylinder machine, only beat that of Mr. Brice by two-fifths of a second!

"Simply Incomparable."

Enagh Manse, Ballymoney, Co. Antrim, 27th February, 1908.

"I have just heard of Mr. F. Newton's wonderful performance on Palmer Cord Tyres. It proves these to be on cars just what I have found them on a motor cycle—simply incomparable.

"I ride all days and in all weathers, and tyre troubles were the bane of my life till I got Palmer's Cords. Now I can ride for months without re-inflating.

"I feel it only due to give you this little bit of my experience, and wish you success.

Signed (Rev.) J. RAMSEY."

Whether for Cycle, Motor Cycle, or Motor,

PALMERS

are "simply incomparable." This all-round excellence is, of course, due to their sound construction on scientific principles.

THE PALMER TYRE LTD., Shaftesbury Avenue, LONDON, W.C.

PHÄNOMEN Motor Cycles.

The Hall Mark of Mechanical Efficiency. **With 2-Speed Gear.**

Death of the Starting Handle.

Any motor cyclist who has handled a **Phanomen** 2-speed machine, would not think of returning to the **old and laborious method of handle starting**, besides, think of the convenience and comfort, being able to **"start up" in the saddle.** No need to dismount in traffic to re-start the engine. Just the very thing for London traffic or touring in mountainous districts. The gear can be changed so rapidly without any shock, and **both feet being free** to preserve balance when **starting or turning in very confined places,** makes this gear stand out as quite the finest thing in variable gears yet put on the market. **Its reliability** has been proved in both this year's **Quarterly Trials.**

Trial runs with pleasure, by appointment.

A Customer writes—

I have a 3 h.p. Phanomen, magneto, 2-speed NALA Gear, and am delighted with it; it is the centre of attraction round here where the NALA is hardly known. I am endeavouring to persuade my friends to speculate in a Phanomen, as they seem quite satisfied with its performances and **I will not sell mine at any price.** I have had nine motor cycles, but the Phanomen beats all.

Showroom: 49, King Square, President Street, Goswell Road, E.C.; also at the Service Co., Ltd., 292, High Holborn, W.C.

Agent for Cardiff and District—ROBERT BEVAN, 31, Castle Street, Cardiff.

PHANOMEN MOTORS.

OCCASIONAL COMMENTS.

By "IXION."

I am Not a Dealer.

One or two readers have written me of late for assistance in the sale or exchange of machines. I wish, therefore, to state once for all that I cannot under any circumstances interest myself in any kind or sort of deal.

Leaky Inlet Domes.

A rider recounts prolonged misfiring with a twin-cylinder Peugeot, misfiring which was the more puzzling because it was confined to the rear cylinder, and was not in any way connected with the ignition. He finally solved the problem by making the dome over the rear inlet valve an airtight fit. The misfiring was most pronounced when the throttle was nearly closed, and this naturally suggested to him that the cause was excess of air supply to the erring cylinder. It is probable that a great deal of misfiring on twin-cylinder motor cycles is ascribable to this cause, especially as riders are for ever meddling with their valves, and the facilities for making a good job of this particular joint are seldom of the best design or workmanship.

More "True" Stories!

A kindly wag has sent me some more "true" motor cycling yarns for readers to add to their collections. One friend of his suspends his machine from the roof of a shed during the winter to save the tyres. One night a mouse, running about the shelf, fell on to the front tyre, and caused the wheel to revolve. The mouse began to climb up the tyre to get to the top, but the wheel continuing to revolve, he made no progress. The owner on coming in next morning found the wheel still revolving, the mouse still scrambling upwards and looking extremely thirsty, while the cyclometer registered no less than eighty-three miles!

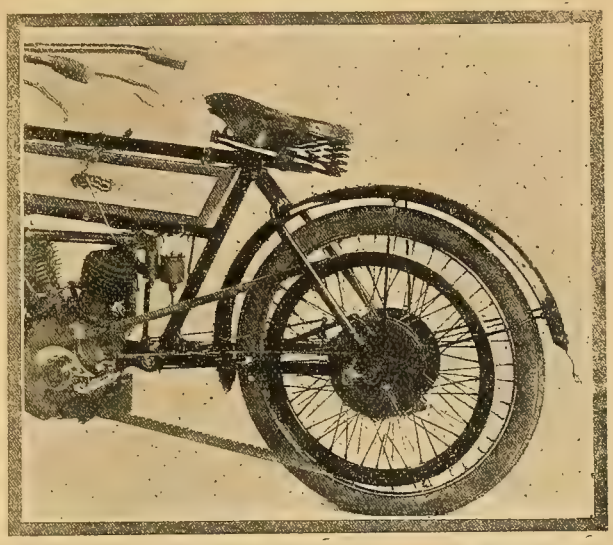
The same writer enjoys the acquaintance of another friend, also a motor cyclist of unimpeachable integrity. This gentleman was one day hung up on the road by some inscrutable magneto trouble. A brilliant expedient finally occurred to him. Seizing a handful of small flints culled from the roadside, he injected them into the cylinder *viâ* the sparking plug orifice. He then replaced the plug, and on pedalling the machine was rewarded by extremely powerful explosions. The explanation of this smart repair was that the piston forced the flinty particles violently together, and caused them to emit the very fattest sort of sparks.

A Point *re* Sidecars.

I do not know how far the average "passenger" motor cyclist has realised one great merit of the sidecar, and this is its great luggage carrying capacity. Luggage looks, and is, an excrescence on the most luxurious tricar, but a sidecar lends itself admirably to baggage. A large Gladstone bag or wicker basket can be carried under the seat, and the spare cover and tubes look positively handsome when strapped to the back of the chair. In addition, a good deal can be carried over the rear wheel of the cycle without getting in the way, as it does over the rear wheel of a tricar, and the weight over the driving wheel is a real advantage, as it gives the tyre a good grip. On a tricar, luggage has to be carried either on side platforms, where it looks ugly and is horribly in the way, or in the trough of the front seat, where it wrings many a malediction from a tender-toed or long-legged passenger. This year I should not be surprised if a sidecarist won the medal offered by *The Motor Cycle* for privately-owned passenger machines in the End-to end.

Ladies' Motor Bicycles.

I am rather sorry to see the majority of our few lady riders still attached to the 3½ h.p. 160 lb. type of machine. Granting that there are a few sturdy unconventional girls, used to managing a powerful horse, to playing hockey, and other exercises demanding muscle and stamina, the majority of girls funk the weight of motor cycling more than anything else. Now that there are first-rate little 1¼ h.p. engines on the



A 1908 Twin Vindec, fitted with the Roc gear and free-engine conversion set by A. W. Wall, Ltd

market, it is possible to get a lady's mount of ample strength and stability scaling no more than 84 lbs., and when Mrs. "Ixion" takes the plunge my specification for her will be as follows:

Engine.—A lightweight, not exceeding 1¾ h.p. at the very outside.

Ignition.—Magneto.

Control.—Handle-bar valve lift; handle-bar interconnected throttle and spark; automatic carburetter; handle-bar emergency switch.

Frame.—Light, dropped, with small tanks (very few ladies go in for 100 miles non-stops); spring forks; spring seat-pillar.

Tyres.—2in. (ladies hate punctures).

Transmission.—Belt, with two-speed pedalling gear to facilitate starting.

Brake.—Hand-applied shoe on rear belt rim.

This machine will be very easy to drive, as the single lever will be merely advanced or retarded, according to severity of work or pace required. It will start, when not gummy, on one turn of the pedals, owing to use of a very low second pedalling gear. It will climb any hill in the country, and it will be easy to handle when she is dismounted.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Pedalling Gear Recommended.

Would you kindly inform me whether or not I am likely to experience any difficulty in starting a 5-6 h.p. twin if I removed pedals and fitted a Mabon clutch with starting handle? —W.H., Brighton.

If you have the clutch fitted, and this clutch is a good one, we should not recommend you to remove the pedals. You never know when you may have to use them, and starting from cold by running alongside is sometimes difficult unless everything is in order.

Single v. Twin-cylinder Machine.

I am intending purchasing a motor cycle in the near future, and should be much obliged if you would give me a general idea of (1) the advantages (if any) to be derived from a twin-cylinder over a single, and also (2) whether the upkeep in the tyres of a twin is greater than that of a single of the same power?—R. U. N., Cheshire.

The advantages of a twin-cylinder are greater flexibility, less noise, and greater ability to pick up speed when checked on a hill, also smoother running. The disadvantages are greater cost of upkeep as regards tyres and fuel, and slightly greater difficulty to keep machine in order. If you are a novice, we think a machine of not more than 3½ h.p. should suit you to begin with.

Gear, Electric Horn, and Lamp Queries.

(1.) What ratio of gear would you advise me to use on my 3½ h.p. machine, my weight being about eight stones, and that of the machine being about 150 lbs.? The present gear is 5¾ to 1. This, however, I find much too low for the level. (2.) I wish to use an electric buzzer in place of the ordinary bulb in conjunction with a dry cell as used for ignition purposes on motor cycles. Would this be perfectly satisfactory, and would it last a whole season without any attention? (3.) What kind of lamp (acetylene) do you recommend, self-contained or with separate generator? —L. 861.

(1.) We should suggest a gear of 4½ to 1. If you have an adjustable pulley you can vary the gear as desired. (2.) If you use an electric buzzer on your horn it will exhaust the dry cell very quickly. Try a 4-volt accumulator. (3.) Each system has its advantages. The self-contained generator has few pipes and orifices to become stopped up. A lamp with a separate generator, however, is considerably lighter, and does not strain the bracket to so great an extent.

Control by Variable Lift of Valve.

Kindly explain how the control of a 3 h.p. Fafnir engine is accomplished, the type which requires no throttle? Do these engines easily overheat as a consequence of this method of control? Can these engines be run at a slow speed? Are the present day engines of this make controlled in the same manner?—M.R.S.

This type of engine is controlled in two ways. The 3 h.p. 75 by 80 mm. type

Mr. Frederick Straight, Secretary of the Auto Cycle Union, on his new Triumph.

(automatic inlet valve) by varying the lift of the exhaust valve which prevents all the exhaust gases from escaping, so preventing a full charge being drawn in. The later type is controlled by a variable lift of the inlet valve, which, of course, has practically the same effect as a throttle. The exhaust control is fairly satisfactory, but liable to cause overheating. The inlet control method is better.

Magneto and Battery Ignition.

On my tricar I have a 6 h.p. twin J.A.P. engine and metal disc clutch with Bosch high tension magneto, D.A.V. type, gear driven, and I want to be able to start engine with the handle. At present I cannot get over compression quick enough with handle to enable magneto to spark. Would a plain coil and dry battery be best? Kindly give me a diagram of the wiring?—F.C.

Handle starting with magneto ignition is very uncertain on motor cycles unless handle is geared up as in Rex, Phœnix, and Roc machines. Fitting a supplementary ignition will cause a good deal of unnecessary complication. By far the best plan is to start the engine on the stand by the pedals, and then put the clutch in the neutral position, raise the stand, and start from a standstill by means of the clutch. As you have a Bosch magneto you would have to fit a separate contact breaker on the engine for battery ignition, which would not be an easy matter.

Reliability of Motor Cycles.

At present I know nothing of motor cycles, but should like to possess one. Kindly tell me if I purchased a motor bicycle of the best make how far I could expect it to run without requiring attention of any description beyond filling with petrol and oil and cleaning? I live in the country, and reliability is of the utmost importance. Of course, I do not include tyres.—B.E.W.

With ordinary luck you should cover at least 1,000 miles on a first-class motor bicycle before it requires attention beyond shortening the belt say twice. It would then be advisable to remove the cylinder to scrape away the carbon deposits. This, together with occasionally draining out the crankcase, grinding the exhaust valve, and cleaning the carburetter jet would be practically all the attention a good magneto-ignited motor bicycle requires for several thousand miles. The bearings of the wheels, of course, require occasional oiling like those of a pedal bicycle.

Sluggish Starting due to Adjustment of Carburetter.

I have a 2¾ h.p. low tension magneto (1905 Clyde) motor bicycle, and have a difficulty in starting same, that is if it has been left for an hour or so, and engine has got cold, it takes me four or five minutes hard pedalling on the stand before I can get it to start, and then I have to put petrol in top of cylinder. When once engine is warm it will start at one turn of the pedal. I am using Pratt's petrol and Moebius air-cooled lubricating oil, and the oil seems to make piston go stiff when cold.—N.W., Cambs.

Provided you inject paraffin or petrol to ease rings, and the engine then starts all right without much pedalling, it shows trouble is due to congealed oil. If it only starts with vigorous pedalling when piston is free it shows that the trouble is chiefly due to carburation, that is to say, you get too much air at the outset. This may be overcome by fitting a shutter over the bell mouth of the carburetter, so that the air may be altogether or partially excluded at the moment of starting. It must, however, be opened immediately afterwards. Always flood the carburetter before attempting to start.

Handle Starting and Carburetter Flooding.

I have had a Mabon clutch fitted to my 3½ h.p. Minerva, and sometimes handle starting is easy, and at other times is difficult. I have tried different positions of spark, throttle, and air, but this does not help me. When I lean the machine over towards the right, viz., the side on which is the jet, the petrol keeps dripping on to the floor. If machine is leant to the left or kept upright, this does not occur. I raised weight on needle valve about one-eighth of an inch, but it is just as bad.—G.F.N.

Small single-cylinder engines are usually hard to start with a handle on the engine-shaft, chiefly due to the lightness of the flywheel, and the fact that sufficient gas cannot be obtained until piston is moving at a fair speed. You may get some help in this direction by fitting a shutter over the air inlet of the carburetter, as suggested in *The Motor Cycle* of February 12th, page 121. There should be no leakage if the needle valve fits properly when the machine is standing upright. Of course, it will usually leak when machine is leaning out of a vertical line, because the action of float is impeded, *i.e.*, it touches walls of float chamber. The remedy is to shut the petrol tap.

Leakage through Joint of Cylinder Head.

I have a 2¾ h.p. Werner engine fitted with detachable head. Owing to the difficulty in making a joint after removing cylinder, and for other reasons, I want if possible to get the head and cylinder fixed together permanently. Is there any process by which this can be done? This engine jumps in frame fixing and cannot easily be made firmer. Would a stay from down tube to a plug at compression tap hole put too great a strain on the side rods of cylinder?—W.R., Dublin.

The simplest way to get over the difficulty would be to fit the head tightly on to the cylinder, fit a new copper and asbestos washer, and paint the joint with fish glue. Probably the safest place to stay the engine from would be one of the holding down bolts by which the separate combustion head is attached. The engine has a high compression and rather small flywheels, and for these reasons a certain amount of vibration will always be present. Fitting stays will only transfer the vibration to another point, and might cause breakage. If the attachment bolt holes in aluminium are worn have them drilled slightly larger and fit new bolts or a tubular sleeve over the bolts.

Competitors in the Glasgow M.C.C. Hill-climb at the Peesweep Hill, Paisley. The event was unfortunately marred by a severe rainstorm.

READERS' REPLIES.

Loose Pulleys cause a Clanking Sound.

I see by your issue of May 13th that "R.C." is troubled with a slight clanking sound. I was myself puzzled by the same thing on the 8th inst., and immediately dismantled the engine, but everything was all right. By chance I revolved the pulley a half turn, and the trouble revealed itself. The key which prevents the pulley revolving on its spindle had worn away the sides of the key-way, and had thus set up a peculiar clanking sound.—K. A. MacDonald

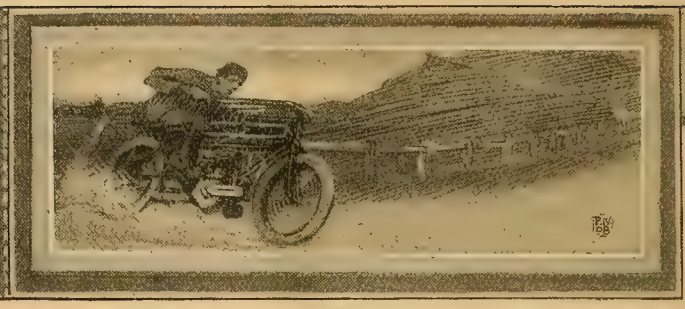
Non-sooting Plugs.

I noticed in a recent issue that "F.P.," Oakham, wanted a sparking plug for back cylinder of a four-cylinder F.N. A few weeks ago you described the Reliance plug, and I immediately got one, as I found the back cylinder of my four-cylinder F.N. flooded with oil, and I had to remove the plug and clean it every time I stopped before it would spark again. Since fitting the Reliance I have never required to touch the plug. The cylinder in which it is fitted is always first to start.—G. A. Gillies.

Re Petrol Supply Impeded.

"G.W.W." (May 13th) appears to have had the same trouble with his carburetter that I had with mine, also a B. and B. carburetter with Longuemare jet, as machine kept on stopping. It would slow down quite gradually. This occurred the same up-hill, on the level, or down hill, going fast or going slowly. The cause was carburetter flooding. I could see the petrol dripping every time the engine began to slow down. Like "G.W.W.," I only had to wait a minute or two, after which I could start again and run another few miles, when the same thing recurred. Towards the end of the day the trouble disappeared as mysteriously as it began in the first place. Evidently, whatever the cause, the trouble was entirely erratic, and not likely to be due to a badly fitting needle or incorrect level of petrol in the jet. This is correct, as a matter of fact. It seemed just possible that the needle had too much play, so a leather washer was put in the cap that covers the needle on the outside of the float chamber. One result of this is that the throttle certainly answers more readily, giving more control at slow speeds, and as yet I have had no more flooding. If "G.B.B." finds it is a case of carburetter flooding with him it is the simplest thing possible to try a leather washer in the cap. It would be interesting to hear whether it has the same effect in his case as in mine.—C.C.M.

CURRENT CHAT.



Special Features

THE A.C.U. OPEN HILL-CLIMB (Illustrated).

A FIVE-CYLINDERED ENGINE (Illustrated).

The Next Issue.

In consequence of the Whitsuntide Holidays the next issue of *The Motor Cycle* will be published on Thursday, June 11th, instead of Wednesday, June 10th. It will contain a fully illustrated description of the M.C.C. London-Edinburgh run, and descriptions and illustrations of other Whitsuntide events.

A Disappointment.

The Naval motor cycle race at the Whitsuntide meeting of the Brooklands A.R.C. has been cancelled for reasons stated on page 431 of this issue, and further races for motor cycles will not be promoted for the present. Every motor cyclist will regret this strange decision, but we are confident that no fair-minded person will admit that motor cycles make nearly as much noise as racing cars.

Advice regarding Police Traps.

We are always obliged to readers who send us news regarding police controls. We should, however, be grateful if our informants would state the exact spot as nearly as possible, the nearest village, and the name of the county in which it is situated.

A Midland Meeting of Motor Cyclists.

The committee of the Birmingham M.C.C. are desirous of feeling the opinion of other Midland clubs on the subject of a general meet on the lines of the Richmond meet of Northern motor cyclists. Club secretaries are requested to write Mr. R. Vernon C. Brook, trials hon. sec., Eastgate, Green Hill Road, Moseley, as to whether they would be prepared to join in a meeting at, say, Stratford-on-Avon.

The Number of Motor Cycles in Madras.

A correspondent tells us there are about twenty-five motor cycles of all sorts at present in Madras. Over there, with the thermometer so high, motor cycling is regarded as one of the coolest pastimes.

Italian Volunteer Motor Cyclists.

Following the example set her by other European nations, Italy has placed a law on the statute books for creating a national corps of volunteer cyclists, motor cyclists, and motorists. The corps will be under the supervision of the Italian War Office.

A Summons Dismissed.

M. J. Lindsay, of Belfast, and C. Dean, of Chester, were recently summoned for riding motor cycles between Rhydtalog and Coed Talon at a speed exceeding twenty miles an hour. P.C. Hughes stated that the motor cyclists were travelling at thirty-six miles an hour. Cross-examined, he said, "I guessed at the speed, and it's a good guess, too." The officer made no attempt to time the defendants, and made no attempt to measure the road, consequently it is not surprising that the Bench dismissed the summons.

FUTURE EVENTS.

June 5-8—M.C.C. LONDON-EDINBURGH RUN and return for Schulte Cup Competition, and Special Cup for Motor Bicyclists.
" 8 (Whit-Monday)—St. Albans Motor Cycle Races.
" 8—Tunbridge Wells Motor Cycle Races.
" 13—Essex Beagles Ten Miles Motor Cycle Handicap at the Stadium.
" 20—Entries close for M.C.C. Team Competition at Daventry.
" 20—Barnsley Victoria C.C. (Motor Section) Open Hill-climb for Motor Cycles.
" 24—London United Tramways Five Miles Tourist Motor Cycle Handicap at the Stadium.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective Competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., Liverpool M.C., North West London M.C.C., and Sheffield and Hallamshire M.C.C.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 6-7—A.C.F. Grand Prix Races for Cars.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.

"Tyred."

Motor Cycle Club for Nottingham.

A few weeks ago it was pointed out in these columns that Nottingham was one of the few large towns in England without a motor cycle club. An enthusiastic local rider noticed this paragraph, set to work, and a motor cycle club is now *un fait accompli.* See announcement in our Club News pages.

A Fatal Collision.

It is with deep regret that we have to record the death of Mr. Harold Clifton, a young Brighton solicitor, who, on the 23rd ult., was riding home at about 11.25 p.m. when he came into collision with a taxicab, and was thrown heavily from his machine. His skull was fractured and his arm broken, and despite every attention he died some hours later without regaining consciousness. Mr. Clifton was an ardent rider and originator of the Brighton and District M.C.C., and it is almost entirely due to his energy and keenness in motor cycling matters that the club has attained its present flourishing condition. His loss will be greatly felt in Brighton, where he was a universal favourite.

A Warning.

For frightening a horse and making "undue noise," one of the no silencer brigade was fined at Greenwich last week. This should be a warning to thoughtless motor cyclists who make use of cut-outs in towns and villages.

The Race Meeting at Hanover.

Rain prevented the holding of the motor cycle meeting arranged to take place at the fast Hanover track on the 24th ult., consequently the organisers found themselves compelled to postpone it until Sunday last, all the competitors having agreed to put in an appearance on that occasion.

A Tip for Anti-motor Policemen.

Policemen who are fond of spending their time looking after motorists might take the advice of James Evans, of Haverfordwest, who a few days ago was summoned for riding his bicycle along a footpath. Evans wrote to the Bench to say "he was sorry the police had nothing else to do but to crouch behind a gate and waylay cyclists." Evans added that the less said about the state of the road the better, and he desired to know whether bicycles or perambulators took up most room. A fine of 6d. was imposed!

Electric Timing over a Trap.

We are informed that the Rainford County Police are about to work a trap electrically on the Rainford Road, between St. Helens and Ormskirk.

Doctors' Opinions of Motor Cycles.

"Motor Cycling for Health," feature commenced in our spring number, was unavoidably crowded out last week, but the article will be continued in our next issue as space permits.

Measured Stretches of Road.

"CE 47" writes that the police are active between Hitchin, Baldock, and Royston. A number of Cambridge motor cyclists have been "had" there. There is also a trap at Fenstanton, on the road from Cambridge to Huntingdon. The police hide behind a hedge in the garden of a lodge on the right hand side going from Cambridge.

The M.C.C. Team Competition.

With eight clubs intending to make a bid for *The Motor Cycle* fifty guinea silver challenge cup on the 27th inst., an interesting competition is assured. We are glad several new clubs will be among the participants. Club secretaries are reminded that entries definitely close on Saturday, June 20th, a week prior to the date of the trials. The competition will start and finish at Daventry as last year, and the course is 100 miles in length.

A Good Ride.

One day last week Mr. Clifford Wilson, of the York County M.C.C., Leeds, riding a 3½ h.p. Triumph, made an attempt on the Leeds-London-Leeds record, previously held by Mr. F. Greenwood. A start was made from Leeds at 2 a.m., and keeping well ahead of his schedule time he went well until near Doncaster, when he was delayed for the opening of level crossing gates. The same delay took place at Newark. He was checked at Tuxford, Stamford, Buckden, Biggleswade, Welwyn, Hatfield, and Highgate. The previous best was beaten by 57m.

A Technical Offence.

At the Kings Heath Police Court last Wednesday J. E. Hall Wright, solicitor, Moseley, was summoned for driving a motor cycle with trailer attached, to the rear of which the number O 2853 was painted in black on a yellow cardboard. It was pointed out by the prosecution that the cardboard was not sufficiently durable to conform to the regulations. Had it been wet weather the question was, what would have become of the cardboard and the lettering. The regulations specified that the letters should be of white on a black plate—not a faint black on a dirty cardboard. Mr. Hall Wright contended that only a technical offence had been committed. He had been motor cycling since 1903, and had never been summoned before. Both his cycle numbers were white on a black ground. The Bench considered that a technical offence had been committed, and ordered defendant to pay the costs.

M.C.C. London-Edinburgh Run.

A record entry has been received for this year's London-Edinburgh twenty-four hours' run, which starts at ten on Friday evening, the list totalling 132. The machines are comprised of the following: 26 Triumph, 15 Vindec Special, 9 Rex, 4 Minerva, 4 Bat, 4 N.S.U., 3 Matchless, and 2 each

Miss Muriel Hind (5 h.p. Rex) paying toll to cross the Menai Bridge, in the Coventry M.C. Twelve Hours' Run to Holyhead.

Brown, Motosacoche, Quadrant, etc. The additional entries are given on page 446. Seventy-six machines have magnetos as compared with fifteen with accumulators, one machine has both, and two, dry batteries. Sixty-two machines have single cylinders, thirty-two two cylinders, and one four cylinders. It is whispered that two-wheelers are preparing for the Schulte Cup systematically. Members from Essex have practised the twenty miles an hour gait until they can ride on time with their hands in their pockets and their eyes shut. Now that the cars are debarred from using speedometers, the bicycles ought to have a fair sporting chance. Competitors should remember the two ten mile limits to which due regard must be paid, viz., one at Colsterworth (between Stamford and Grantham) and one at Retford. Mr. S. H. Fry, in sending us the entries, asks, "What will it cost the Motor Cycling Club if all the 132 entrants get through and claim a gold medal?"

To London-Edinburgh Competitors.

Mr. R. W. Moore, of Stamford, advises us that fresh stone is being laid on the road 100 yards north of Casterton. London-Edinburgh competitors should make a mental note.

Start of the London-Edinburgh Run.

The first of the motor bicyclists will be started by Mr. S. F. Edge at 10 o'clock on Friday evening next, near the Old Gatehouse at the top of Highgate Hill. The remainder of the competitors will be despatched at intervals of thirty seconds. The motor bicyclists number 97.

Another Birmingham Race Meeting.

Owing to the great success attending the *Sport and Play* Cycle and Motor Cycle Tournament at Aston on the 23rd ult., the promoters have decided to hold another big meeting with an even more attractive programme on Saturday, July 4th.

The Sutton Bank Hill-climb.

The really wonderful success of Rex machines at the A.C.U. open hill-climb last Saturday cannot be overlooked. In three classes they were first, and also obtained places. Contrary to some people's expectations, the winning machines made very light work indeed of the 1 in 4 gradient.

Winner of the Rolls Cup.

The winner of the Rolls Cup, presented by the Hon. C. S. Rolls to the Cambridge University M.C.C., was decided on a formula which included the marks gained in a hill-climbing competition on Sharpenhoe Hill, see page 447, and a consumption and reliability trial on May 23rd, is E. B. Dickson, 5 h.p. Vindec Special. The complete results will be published next week.

Speed Trials at Portmarnock.

The M.C.U.I. (Dublin Centre) held some motor cycle speed trials at Portmarnock beach on Saturday last. The results were as follows: Two miles members' handicap, out and home course, fifty yards pedalling allowed at the start, and fifty yards at the turning point.—1, C. E. Murphy, 3½ h.p. Triumph (84 by 86 mm.), 25s.; 2, S. Findlater, 3½ h.p. Jap (85 by 76 mm.), 30s.; 3, P. Hurse, Peugeot (75 by 75 mm.), 60s. Winner's time, 3m. 30⅗s. Twenty miles open handicap, pedalling permitted (needless to say it was not indulged in except at the turning points).—1, S. Findlater, 3½ h.p. J.A.P., 36m. 29⅗s.; 2, C. E. Murphy, 3½ h.p. Triumph, 36m. 34s.; 3, B. Dunphy, 85 by 85 mm. J.A.P., 37m.; 4, C. B. Franklin, 85 by 85 mm. J.A.P., 40m.

Inter-club meet of the Hull A.C.C. and Leeds M.C.C. at Pocklington, East Yorkshire, on the 24th ult.

THE A.C.U. Open hill climb

THE A.C.U. annual hill-climb held this year in conjunction with the Newcastle and District Motor Cycle Club took place on Saturday last in glorious weather. The event, which had been in everybody's mind since the holding of it was first announced, was a great success and attracted a crowd of enthusiastic spectators. The fact that the competition brought together the Northern, Southern, and Midland men did much to promote good feeling in every direction, and the officials of the A.C.U., the Newcastle and District, the Scarborough and District, and the Hull Motor Cycle Clubs all worked together with a will. The police did excellent work, but for both them and the numerous marshals the crowd proved rather too much. They did all they could and worked conscientiously and well, but the people seemed to be incapable of realising the danger of remaining in the middle of the road or on the wrong side of the dangerous corner. The hill has already been described and illustrated in *The Motor Cycle* (see issues May 13th and 27th), but a few further remarks about it may be desirable. The shape of the course, especially near and at the corner, is like—but, of course, much worse than—Fish Hill, Broadway, near Evesham. The gradient on the trough is terrible (1 in 3.96), but the men had a fair chance at this, the chief difficulty being to pick up speed after negotiating the corner (1 in 6.10). The condition of the road as regards surface has in no way been exaggerated by our contributor, Mr. B. H. Davies. It is fairly firm, but full of holes, due to rain washing away the binding material of the road.

The Weighing in.

Most of the morning was spent by the officials in weighing the machines and riders, and by the latter in practising on the hill. The weighing was in charge of Messrs. E. Hawkins, L. Bates, and H. G. Cove, who were kept extremely busy. Mr. E. A. Greathed, who marshalled the men at the start, did excellent work, and got the first man smartly off the mark punctually at 2 p.m., the advertised time. Mr. F. Straight took the time at the foot of the hill, and Mr. A. G. Reynolds at the summit.

In Class I. (for lightweight machines) there was only one competitor, R. G. Bell (2 h.p. Moto-Rêve), the other, G. L. Fletcher, having been run into by a motor cyclist, who was taking no part in the competition, during a practice spin. Bell travelled well till he got to the corner, which is about halfway up the course, and then had to dismount.

In Class II. (for machines with engines not exceeding 82 mm. bore, minimum weight of rider 154 lbs.), R. M. Brice (3½ h.p. Brown) made fastest time, 0; and F. Scriven (3½ h.p. Rex) came next, 3⅖s. slower. Of the rest, E. S. Myers (3½ h.p. Triumph) fell at the corner, H. Newey (3½ h.p. L.M.C.) dismounted about forty yards from the top, and S. W. Carty (3½ h.p. N.S.U.) fell at the corner.

In Class III. (for machines with engines not exceeding 85 mm. bore, minimum weight of rider 154 lbs.) J. Marshall (3½ h.p. Triumph) made the fastest time, 0; Brice came second, 3⅖s. slower; McMinnies (3½ h.p. Triumph), 16⅕s.; and the rest as follows: G. Lee Evans (3½ h.p. Rex), 23⅕s.; W. E. Grange (3½ h.p. Triumph), 35s.; and Captain Sir R. K. Arbuthnot, Bart., 51⅗s. Grange dismounted near the summit. Newsome (3½ h.p. Triumph) lost some ballast on his first ascent, then had another try and did likewise, and so was disqualified. Newey again dismounted near the finish. The following men took the difficult corner in splendid form: Marshall, Brice, and Sir R. K. Arbuthnot.

Class IV. (for twin-cylinder machines not exceeding 76 mm. bore in each cylinder, minimum weight of rider 154 lbs.).—Godfrey (5 h.p. Rex) again proved a winner, 0 (It was a field day for Rex machines); F. Applebee, jun. (5 h.p. Rex), 4⅖s. slower; F. Applebee, sen. (5 h.p. Rex), 18s.; J. Scriven (5 h.p. Rex), 18⅕s.; W. H. Wells (5 h.p. Vindec), 19⅕s.; J. F. Mallett (6 h.p. N.S.U.), 28s.; and G. Raper (6 h.p. N.S.U.), 36⅘s. Godfrey rode with great skill and daring, and was heartily applauded. Scriven made two ascents, as on the first occasion he took the wrong road and did not pass the timekeeper. Wells was a great favourite, and though he drove steadily round the corner he made an excellent ascent. Mallett, though a heavy rider, also did well.

Class V. (for machines with twin-cylinder engines not exceeding 85 mm. bore in each cylinder), minimum weight of rider 154 lbs.—Godfrey again carried off the honours, 0; and Applebee, jun., was again next in order, being 9⅕s. slower, while the rest figured as follows: F. Scriven, 15⅗s; W. H. Wells, 21⅕s.; J. F. Mallett, 24⅕s.

Class VI. (open to entrants in all the above classes).—Godfrey and his twin Rex for the third time proved to be invincible 0, and Applebee, jun., also on a twin Rex, was again second, being only 2⅕s. behind him, while the following differences in seconds elapsed

The A.C.U. Open Hill-climb.

between the rest: J. Marshall (3½ h.p. Triumph), 5⅗s.; T. H. Tessier (6-7 h.p. Bat), 5⅘s.; W. H. Wells (5 h.p. Vindec), 10⅗s.; F. Scriven (5 h.p. Rex), 11s.; W. J. Newsome (3½ h.p. Triumph), 14⅗s.; F. Applebee, sen. (5 h.p. Rex), 19⅘s.; W. G. McMinnies (3½ h.p. Triumph), 20⅗s.; G. Lee Evans (3½ h.p. Rex), 24s. Of the less fortunate ones, Myers (3½ h.p. Triumph) failed near the finish, and McMinnies came a cropper at the corner, while Marshall, Newsome, and Lee Evans were much applauded for their excellent riding.

Class VII. was confined to machines fitted with change speed gears. The competitors were drawn up on a gradient of about 1 in 18 to 1 in 20, and had this class were as follows: G. Raper (6 h.p. N.S.U., N.S.U. gear) 0, though he made a rather bad start; C. A. Palmer (5 h.p. Roc, Roc gear), 31s.; W. Milnes (3½ h.p. Phelon and Moore), 41s.; W. Newman (4 h.p. Roc Roc gear), 1m. 1⅗s.; F. W. Barnes (3½ h.p. Zenette, Gradua gear), 1m. 34⅕s.; the Scott stopped at the corner, and then restarted, 1m. 4⅖s.

The passenger class was only represented by two competitors, of whom only one, R. Benson-Smith (6 h.p. N.S.U. tricar, with Nala gear and belt drive), made a successful ascent; time, 3m. 54⅖s.

Just as the last named competitor started a terrific thunderstorm came on, and the rain fell in torrents. Everyone agreed that the hill-climb was the most successful which the A.C.U. has ever held.

Scenes at the A.C.U. Open Hill-climb at Sutton Bank.

Weighing competitors and machines at the hill foot.
O. C. Godfrey making the fastest ascent of the day. He rode a 5 h.p. Rex.
Resting before the start of the competition.
A. Scott finishing in the variable gear class.

to start from the saddle by engaging the gear. These performances were most interesting, and served to show how comfortably a properly equipped modern motor bicycle may be started from standstill uphill without any physical exertion. All complied with the rule satisfactorily, but particularly good starts were made by C. A. Palmer (5 h.p. Roc, Roc gear), A. A. Scott (3½ h.p. twin-cylinder, water-cooled, chain-driven, two-stroke Scott, Scott gear—an interesting machine, of which we hope to hear more at an early date), W. Newman (4 h.p. Roc, Roc gear), and J. Stuart Shaw (5 h.p. Phänomen, Nala gear), who got away from the mark in excellent form. The results of

The following officials assisted in the organisation: Judges, Messrs. R. Todd, E. M. P. Boileau, H. G. Cove, and G. Todd. Chief marshals, Messrs. E. A. Greathed, T. Straker, and J. W. G. Brooker. Marshals, L. Rosenvinge, W. H. Outwin, and R. L. Atkinson (Newcastle and District M.C.C.), V. Butters, A. Willis, F. Boxhall, R. Alkester, and F. Green (Hull). Clerks of the scales, E. Hawkins and E. L. Bates (Newcastle). Stewards, Messrs. F. G. Robson, C. Pugh, T. S. Webster, J. W. F. Tranmer, and F. Pinkney (Scarborough). Valuable assistance was also rendered by Mr. S. W. Carty (hon. sec. the Newcastle and District Motor Cycle Club.)

CLUB NEWS.

Western District M.C. (London).

Members of the above club are reminded of the reliability run to Salisbury and back on June 14th for the silver cup given by the president. Intending competitors should send at once to the sports secretary, C. Gould, 10, High Road, Chiswick, for rules and regulations.

Lincolnshire M.C.C.

There was a very representative meet at the Shades, Spilsby, on Saturday, all districts being represented.

A hill-climb has been arranged for Thursday week, the 11th, in the private park at Syston, near Grantham, Sir John Thorold having kindly given permission. There must be no practising on the hill before the day.

To-night (Wednesday) the members meet at the Royal Oak, Newark, and to-morrow (Thursday) at Southwell, at the famous Saracen's Head, when Mr. J. Arthur Mettham, secretary of the Grantham Centre (an architect of repute), will conduct the members over the Cathedral.

On Monday the reliability trial over two routes of 125 miles each takes place, and great interest is aroused in the event.

Coventry M.C.

On Saturday last the above club held a twelve hours run from Coventry to Holyhead, when twenty-six members were sent off by Mr. H. W. Staner, the official starter, at 7 a.m., *viâ* Shrewsbury, Llangollen, and Menai Bridge. The following motor cyclists successfully completed the run within twelve hours, including stops for lunch and tea, and will be awarded certificates: Miss Muriel Hind (5 h.p. Rex), W. Grew (3½ h.p. Triumph), G. Smith (3½ h.p. Triumph), C. J. Hart (5 h.p. None), R. G. Thomas (3½ h.p. Brown), C. S. Burney (3½ h.p. De Havilland), T. W. Drayton (3½ h.p Triumph), C. W. Hathaway (3½ h.p. Triumph with sidecar), A. Wright (3½ h.p. Triumph), John V. Pugh (3½ h.p. Lloyd), A. B. Jepson (3½ h.p. Triumph), R. T. Weallans (2½ h.p. Rover), and A. M. Startin (5 h.p. Riley tricar). Harold Williamson (3½ h.p. Rex) experienced very hard luck with a punctured tyre quite early in the day, and although he changed the air tube he again met with tyre troubles further on. He reached Holyhead outside the schedule time. A medal and two prizes will be awarded, when the results have been calculated, to the competitors who adhered closest to a mean average speed of 19 m.p.h. Fine weather favoured the event, and everything passed off successfully. The majority of the competitors returned the following day by various routes. The thanks of the club are due to Mr. John V. Pugh, who kindly placed his Lanchester car and driver at the disposal of the officials; also to all the checkers and assistants and the timekeeper, Mr. E. J. Hardy.

Coventry M.C. Run to Holyhead. Mr. and Mrs. C. W. Hathaway (3½ h.p. two-speed Triumph with Millford sidecar) on the Isle of Anglesey.

Bradford M.C.C.

On the 24th ult. the long distance reliability trial for the N.S.U. cup was held. The route selected was Bradford to Keswick and back—a total distance of 192 miles. W. Milnes (the holder of the N.S.U. cup 1907-8) was the first starter and left the Central Garage at 8 a.m. prompt, the other competitors following at 1m. intervals. There were four surprise checks *en route*, and the competition eventually proved to be a victory for J. Marshall, who rode a 3½ h.p. Rex, he having lost the least number of marks of any competitor (52). Punctures were the greatest source of trouble to the competitors.

Motor Cycle Union of Ireland (Ulster Centre).

A reliability non-stop run in connection with this centre was held on the 23rd ult. to Ballycastle, a distance of sixty-five miles, and for the purpose of deciding the winner a hill-climb under sealed handicap took place from Glendun Bridge for three miles up the mountain, only those recording non-stop runs being eligible to take part in this part of the competition. A very satisfactory entry was received, and the roads being in good condition the run proved most enjoyable. The hill-climbing contest resulted as follows:

		Gross time.	Handicap.	Nett time.
		m. s.	m. s.	m. s.
1.	J. Stewart (3½ h.p. Triumph) ...	6 0⅖	scratch	6 0⅖
2.	C. Montgomery (3 h.p. Rover) ...	8 47	2 25	6 22
3.	S. J. M'Dowell (3 h.p. Triumph)	7 58⅖	1 30	6 28⅖
4.	T. Dickson (3½ h.p. Triumph) ...	6 30	scratch	6 30
5.	J. Kane (3½ h.p. Triumph) ...	7 9⅕	0 30	6 39⅕
6.	F. H. Maclean (3½ h.p. Triumph)	7 48⅕	0 30	7 18⅕
7.	J. M'Allen (3 h.p. Rover) ...	9 49	2 30	7 19
8.	T. T. Maclean (3½ h.p. Triumph)	8 24⅖	0 25	7 59⅖
9.	W. Wilson (2¾ h.p. Minerva) ...	8 4	scratch	8 4

Starter, Mr. J. S. Garrett. Timekeepers, Messrs. R. M'Lardy and Philip Patterson. Messrs. Chambers Motors, Ltd., kindly placed a car at the disposal of the committee.

Harlesden C. and M.C.C.

This club had an impromptu speed-judging contest on the 23rd ult. The event was over eight miles—four out and four back—the speed fixed being 16 m.p.h. The result was as follows:

1.	M. H. Millis (3½ h.p. Whitley)	29m. 46s.
2.	H. J. M. Hughes (3½ h.p. Brown) ...	30m. 29s.
3.	L. Holmes (3½ h.p. Minerva)	30m. 32s.
4.	E. W. Bishop (2¾ h.p. De Dion) ...	29m. 0s.
5.	H. Boyer (2¾ h.p. Bat)	32m. 10s.
6.	H. Lowe (4 h.p. twin Peugeot) ...	33m. 0s.

In addition to the speed-judging contest and slow race previously arranged, it has been decided to hold a twelve hours reliability trial. This event is down to take place on June 28th, and a medal will be given to each rider getting through in the prescribed time.

The hon. secretary, Mr. E. W. Bishop, of 25, Bolton Road, Harlesden, will be pleased to hear from any motor cyclist desirous of joining the club.

M.C.C. LONDON-EDINBURGH RUN.

In addition to the entries for the M.C.C. London to Edinburgh twenty-four hours run given on page 426 of our last issue, the following have since been received, bringing the total to 132:

*H. P. Beasley (5 h.p. Rex), *A. Sharp (4½ h.p. A.S.L.), *J. O. M. Dixon (3½ h.p. Vindec Special), P. C. Camparíole (3½ h.p. ———), G. Rowden (3½ h.p. Bat), W. H. Bishop (3½ h.p. Vindec Special), *C. E. Woodger (5 h.p. Eland), H. C. Harriott (3½ h.p. Triumph), H. Cowlin (3 h.p. Triumph), A. Jelks (3 h.p. Chase), *J. Winslow (5 h.p. Rex), P. E. Quick (3½ h.p. Triumph), J. H. Brooks (3 h.p. Lincoln Elk), S. H. Clay (4½ h.p. Minerva), *O. C. Godfrey (5 h.p. Rex), J. H. H. Robinson (6 h.p. N.S.U.), H. Childe (3½ h.p. Triumph), P. Janson (3½-4 h.p. Bat), *A. Manning Lomax (3½ h.p. Triumph), F. G. Smith (3½ h.p. Triumph), W. Adam (3½ h.p. Triumph), A. O. Holmes (5 h.p. Crypto), G. E. Purchase (3½ h.p. Triumph), Wm. Pratt (3½ h.p. Phelon and Moore), C. Gordon Watson (2¾ h.p. F.N.), and F. A. Hardy (6 h.p. Panhard tricar).

*Entrants for Schulte cup competition and special cup for motor bicyclists.

Club News.—

Walthamstow M.C.

The club held its first competition of the year on the 23rd ult. in the shape of a reliability trial from Woodford to Newport and back. Seven made non-stop runs on the outward journey, and on the return journey five finished to time. Winners: F. W. Applebee (5 h.p. Twin Rex), W. H. Applebee (3½ h.p. Rex Tricar), C. W. Lee (2¾ h.p. De Dion), A. H. White (car), and J. W. Percival (6-8 h.p. Fafnir Tricar). The Whitsun tour is to Great Yarmouth.

Newcastle and District M.C.C.

New forms of competition have always been a strong point with this club, and the latest consists of a series of team trials being run off on the Calcutta Cup principle, the interest in which is sustained over a period of a couple of months, till the finals prove the survival of the fittest. The preliminary ties are run off over a course of fifty miles, from Gosforth Wagonway to Newton-on-the-Moor and back. One mark is awarded for each mile or part of a mile covered by each competitor before he has a stop, at a maximum speed of 20 m.p.h. and not less than 15 m.p.h. As the teams are drawn against each other in pairs, the teams scoring the most marks in each ride go into the next round. Ten teams entered, and the first round has now been run off, with the following results:

RIDDEN TUESDAY, MAY 19TH, AT 6 P.M.

Mr. L. Austin's team beat Mr. H. M. C. Bell's team.

	Marks.		Marks.
L. Austin (3¾ N.S.U.)	50	H. M. C. Bell (4 N.S.U.)	50
W. Parker (3½ N.S.U)	50	J. Westmacott (4½ Minerva)	50
W. Dunn (3½ Dene)	50	J. N. Grey non-starter.	
S. Svendsen (4½ Minerva) non-starter.		I. Grey non-starter.	
	150		100

Mr. E. L. Bates's team beat Mr. R. L. Atkinson's team.

E. L. Bates (5½ N.S.U.)	50	R. L. Atkinson (3¾ N.S.U)	50
D. M. Mallett (3¾ N.S.U.)	50	W. P. Ward (3¾ N.S.U.)	50
E. B. Nicholson (3½ Hobart)	50	G. Thirlwell (5½ N.S.U.)	29
S. Hudson (3½ Hobart)	50		129
	200		

RIDDEN WEDNESDAY, MAY 20TH, AT 6 P.M.

Mr. W. Outwin's team beat Mr. J. F. Mallett's team.

W. Outwin (3½ Triumph)	50	J. F. Mallett (6 N.S.U)	50
A. Fenwick (5 Vindec)	50	R. B. Smith (6 N.S.U.)	50
R. Wilson (4 N.S.U.)	50	G. Raper (6 N.S.U.)	50
F. G. Wilson (2½ Quadrant)	50	B. Dodds (4 N.S.U.)	29
	200		179

Mr. L. Rosenvinge's team beat Mr. V. Corbett's team.

L. Rosenvinge (3¾ N.S.U)	50	V. Corbett (5½ N.S.U.)	2
B. Bradford (6 Dene)	50	J. Gilchrist (3 Kerry)	50
R. Embleton (3½ N.S.U.)	50	J. Garbutt (3½ Fafnir)	50
T. Thompson (3½ N.S.U.)	50	J. H. Thompson (3½ Fafnir)	50
	200		152

RIDDEN TUESDAY, MAY 26TH, AT 6 P.M.

Mr. A. D. Nicholson's team beat Mr. S. W. Carty's team.

A. D. Nicholson (3½ Triumph)	50	S. W. Carty (1¼ N.S.U.)	50
J. J. Hall (3 Quadrant)	50	G. Dryson (3½ Triumph)	50
T. W. Hall (3½ Quadrant)	50	R. Ellis (8 Minerva)	50
J. S. Tweddle (3¾ N.S.U.)	48	F. R. Jack (3 N.S.U.)	41
	198		191

As a consequence, the five teams mentioned in the left-hand column go into the next round, which must be run off before June 30th. Three teams will be left in the final, and each of these teams must ride against the other two; thus the team gaining the greatest aggregate number of marks in these two final runs will be declared the winner.

Mr. E. Hawkins, chairman of committee, acted as timekeeper and judge, and several members of the club kindly assisted as checkers and marshals on the route.

The club will meet at the Royal British Hotel, Edinburgh, on Sunday, the 7th inst.

An all-night reliability trial will be run from Barras Bridge, Newcastle, to Edinburgh and back, by the coast road, on Sunday, June 14th.

Cambridge University M.C.C.

The hill-climbing competition at Sharpenhoe for the Rolls and Moreing cups resulted as under mentioned. It should be noted that a reliability trial will also be held in order to further determine the winner of the Rolls cup:

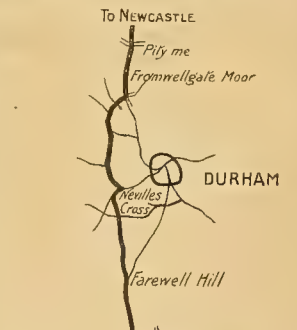
Name	Machine.	Bore and stroke.	Time.	Figure of merit.
C. H. Stephenson*	(3½ h.p. Triumph)	82×86	50s.	21.51
N. W. Hutchinson	(3½ h.p. Triumph)	82×86	51⅖s.	22.93
W. G. Ross	(3½ h.p. Triumph)	84×86	55⅗s.	23.07
E. D. Dickson	(5 h.p. Vindec)	75×76	47s.	23.91
J. M. Oakey	(5 h.p. Vindec)	75×76	47s.	24.64
E. H. Lees	(3½ h.p. Triumph)	84×86	52⅘s.	25.51
F. M. F. Pilkington	(3½ h.p. Triumph)	84×86	57⅖s.	25.76
C. L. Mere	(3½ h.p. Triumph)	84×86	54⅘s.	26.49
A. R. Yorke	(3½ h.p. Triumph)	82×86	61⅗s.	26.89
C. Wingate	(6-7 h.p. Bat)	76×95	40⅗s.	27.71
F. P. Dickson	(5 h.p. Vindec)	75×76	52⅗s.	27.89
A. R. Murrey	(3½ h.p. Triumph)	84×86	63s.	28.27
B. Milburn	(7-9 h.p. Bat)	85×95	39s.	31.27
E. H. Lees	(7-9 h.p. Peugeot)	80×98	35s.	31.54
C. H. Stephenson	(6-7 h.p. Bat)	76×95	50⅖s.	34.74
V. F. M. Oliver	(5½ h.p. G.B.)	75×80	55⅘s.	35.46
R. G. Heyn	(5½ h.p. Rex)	76×80	48s.	36.96

*Winner of the Moreing cup.

All the competitors machines were of 1907 or 1908 patterns.

The M.C.C. London to Edinburgh Run.

The committee of the M.C.C. having decided to avoid Durham on the way to Edinburgh, and so escape the tortuous streets of the former city, it is advisable to indicate to competitors the official route by means of a map, as, if they are not thoroughly conversant with the district, it is very easy to take the wrong turning. Mr. S. W. Carty, who has drawn the sketch map for *The Motor Cycle*, says: "Great care should be used in passing through Ferryhill and descending the steep hill out of same. The road then runs straight to Sunderland Bridge, where a very awkward and dangerous descent is met. This finishes on the bridge over the River Wear. After crossing the bridge, turn right, then straight up Farewell Hill, where bear left at fork. Easy run then for one mile, where keep straight on at cross roads, then a switchback run for nearly half a mile, when turn right. Sharp ascent for three hundred yards to Neville's Cross, then turn left. Easy road for one mile, when turn left and almost immediately right. Bear right at next fork, and straight on at cross roads. At Framwellgate Moor Inn turn sharp left, and straight on by North Road to Newcastle-on-Tyne. Competitors are advised to use great caution on this road, as vehicles often swing sharply across the road from byroads. It will be well patrolled with police, and indicating arrows will be fixed by the members of the Newcastle and District Motor Cycle Club."



IMPORTANT NOTICE.

On account of the Whitsuntide Holidays, the next issue of "The Motor Cycle" will be published on Thursday, June 11th, instead of Wednesday, June 10th.

Club News.—

Black Boy Motor and Athletic Club.

A club under the above name has just been formed, and intending members can have full particulars by applying to the hon. sec., M. Helsen, 27, Somerset Road, South Tottenham, N.

Nottingham and District M.C.C.

The above club was successfully inaugurated on Monday of last week, thirty-three gentlemen interested responding to the notice of the meeting. Mr. J. C. Scothern presided, supported by Mr. F. Straight, of the A.C.U. Mr. C. H. Spring, who at present occupies the position as hon. secretary to the N.C.U. (local centre), was elected hon. secretary, Mr. E. G. Young captain, and Messrs. Holmes and Brough vice-captains, with a committee of ten.

The Liverpool M.C.

The result of the hill-climb held on May 16th is as follows: Single-cylinder Class.—1, G. Hunter (3½ h.p. Fafnir); 2, H. Brookes (3½ h.p. Brown); 3, F. C. Jones (3½ h.p. Rex). Multi-cylinder Class.—1, G. Owens (5 h.p. Peugeot); 2, C. A. Kendall (5 h.p. Rex); 3, H. Weedon (5 h.p. Waverley-Peugeot). Passenger Class.—1, S. Granston (7 h.p. Waverley-Jap); 2, F. M. Lee (6 h.p. Waverley-Jap); 3, H. Weedon (5 h.p. Waverley-Peugeot).

Barnsley Victoria C.C. (Motor Section).

The motor cycle section has been presented with a challenge trophy, value twenty-five guineas, for annual open competition in hill-climbing. This valuable trophy will be held for a year by the rider who makes fastest time in the club's annual open hill-climb. It will become the outright property of the rider who wins it two years in succession or three years in all. The trophy, which has been presented by Mr. Henry Littlewood, of the Royal Hotel, Barnsley, will be known as the Littlewood trophy, and the first competition is fixed for June 20th, on Stainboro' Lowe, at 3 p.m. There will be three classes, and gold and silver medals will be given for the first and second fastest times in each class, the Littlewood trophy to be for the fastest time in any class. Entry forms and full particulars may be obtained of Bernard Siffken, Victoria Hotel, Barnsley.

Glasgow M.C.C.

The results of the hill-climbing contest on the 16th inst. compiled on formula $\frac{\text{Weight}}{\text{Capacity} \times \text{time} \times \text{gear}}$ are as follows:

CLASS A.—Single-cylinder engines not exceeding 80 × 80.

Competitor and machine.	Weight. lbs.	Gear.	Time slower than X fastest M.	Time slower than X fastest S.	Fig. of merit
1. James Roberts (3½ h.p. N.S.U.)	349¼	5.17	1	46	610

CLASS B.—Single-cylinder engines exceeding 80 × 80.

1. A. G. Bostock (3½ h.p. Triumph)	359½	4.55		36	902
2. R. A. McMillan (3½ h.p. Ormonde)	357	4.4		55	832
3. John Miller (3 h.p. Kelecom)	275½	4.5		38	802

Also competed: William Hood (3½ h.p. Triumph), P. W. Edmondson (3½ h.p. Rex), R. Barge (3½ h.p. Minerva), Glen Fulton (3¾ h.p. N.S.U.), J. S. Bryce (3½ h.p. Quadrant), S. Young (3½ h.p. Quadrant), and Wm. Hutchinson (3½ h.p. Minerva).

CLASS C.—Multi-cylinder engines.

1. E. L. Matthew (4½ h.p. F.N.)	352½	5.93		25	852
2. D. F. Bostock (6 h.p. N.S.U.)	411¼	4.		X	811
3. C. H. McMillan (4½ h.p. F.N.)	394½	5.93		59	796

Also competed: William Deans (4½ h.p. Minerva), George Hoggin (5 h.p. Vindec), H. H. Simpson (5 h.p. Vindec), and James Ross (4 h.p. Kerry).

Machines having 24in. wheels were debited with the difference of gear between 24in. and 26in. wheels. The winner in each class is awarded a gold medal.

The Eastern District M.C.

On the 7th inst. a Whitsun tour commences in Essex and Suffolk, and on the 14th the run is to Great Canfield.

The president, Mr. F. Leverton-Harris, M.P., has kindly promised a trophy for competition.

All communications in future are to be made to Mr. F. W. James, 2, Benworth Street, Harley Street, Bow, E., London, the new hon. sec.

Cardiff M.C.

Entries close to-morrow (Thursday) for the 200 miles run from Cardiff to Newport, Usk, Raglan, Monmouth, Whitchurch, Ross, Peterston, Hereford, *viâ* Dinmore Hill, Leominster, Ludlow, Craven Arms, to Church Stretton, and return by same routes. The distance must be covered within twelve hours, and competitors may choose their own day for the trial. The award is a club gold medal.

Leeds M.C.C. and Hull A.C.C.

About forty members of the above clubs attended the inter-club meet at Pocklingdon, East Yorkshire, on the 24th ult. A hill-climbing competition resulted in a win for A. B. Hughes (N.S.U.).

The trials secretary of the Leeds M.C.C. would be glad of assistance from motor cyclists and others who will help in

At the start of the Motor Cycle Union of Ireland (Ulster Centre) reliability run to Ballycastle.

checking the competitors at the different points along the route of their Leeds to Edinburgh run, which takes place on June 13th next. Offers of assistance should be sent to Mr. G. E. Tennant, trials secretary, Leeds M.C.C., Beechville, Ellers Grove, Roundhay Road, Leeds. Entries for the above event close to-day (Wednesday) at ten o'clock.

Dublin and District M.C.C.

The first competition organised by the club was held at the Long Hill, Sugar Loaf Mountain, Co. Wicklow, on May 23rd, under the most agreeable weather conditions. The number of spectators was considerable, and the hill was practically devoid of traffic and the surface good. The winner was decided on the formula $\frac{W}{C \times T \times G}$, and the results are as follows:

Rider and machine.	Position on formula.	Time above fastest man as zero.
R. H. Taaffe (3½ h.p. Triumph) ...	1	X
F. J. Walker (5 h.p. Rex) ...	7	0m. 21s.
J. Browne (3½ h.p. Triumph) ...	5	0m. 25⅕s.
W. H. Mowlds (3 h.p. Royal Roebuck) ...	3	0m. 38⅗s.
M. J. Chambers (2 h.p. Minerva) ...	2	0m. 51s.
H. Molloy (2¾ h.p. F.N.)	4	1m. 12⅘s.
J. Healy (3½ h.p. Rex)	6	2m. 48⅕s.
V. A. Barton (3½ h.p. Rex)	8	3m. 49⅖s.

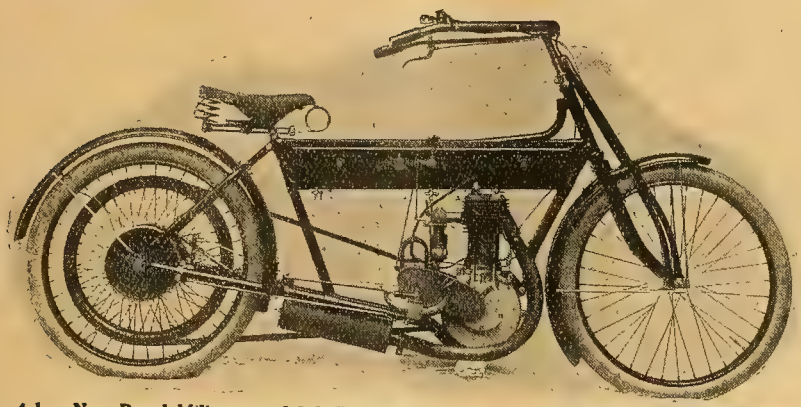
Dr. White was starter, and Mr. J. Keating timekeeper.

Club Hon. Secretaries, Reporting Hon. Secretaries, Press Photographers, and others would greatly facilitate the publication of news items and illustrations if they would make use of the special red envelopes which have been provided for the transmission of news and photographs posted on Saturdays. These special envelopes can be obtained on application to the Editor, "The Motor Cycle," Coventry. Reports should be as terse as possible.

THE

ROC

"The car on two wheels" built for comfort.



4 h.p. New Royal Military model, ball bearing engine, with Roc Clutch, hand starting, and Roc speed gear, 48 guineas.

QUICK DELIVERIES OF ABOVE STANDARD MODEL.

NOTE.—The ROC with live axle is the key to the future of motor cycles. NOTE also the Duplex tanks, the Duplex frame, the comfortable low riding position, the efficient silencer—the car like design.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Gudgeon Pin Fastenings.

[3344.]—Like Messrs. B. H. Davies and W. Merritt, I also have had the pleasure (?) of paying for a new piston which was smashed by an exhaust valve head. Possibly others may be found who have had a similar experience, but I hope Mr. J. Hayton's scepticism will not be removed by a practical demonstration on his own machine. One could hardly wish one's worst enemy that misfortune.

P 2870.

Ordering Spares by Wire.

[3345.]—There are two sides to most questions, Mr. Editor. Does payment with order invariably secure prompt attention? I fear not. Much as those motor cyclists who forget to pay *after* order has been completed must be condemned, what of those firms who receive payment with order and then leisurely take their time to despatch a part urgently required? I speak from experience. ALEXANDER ROGER.

[3346.]—The leaderette under the above heading certainly deals with a question which we see with pleasure put before the public. Every day we receive numbers of telegrams for spare parts, and not in one instance in twenty does a remittance accompany the wire. We are among those firms who will soon be reluctantly compelled to insist upon payment before despatch of the parts required, which will naturally mean much inconvenience to customers, our reason being, of course, the one mentioned in the leaderette. If customers when purchasing their mounts would only leave a small deposit for spare parts, the difficulty would be entirely solved, and we hope that your readers will recognise the good sense of your remarks. THE MOTO-REVE CO.

[3347.]—*Re* the leaderette under the above heading. In compliance with the request of many customers, we have opened accounts with persons for small spares for immediate delivery of same.

We may add that the most we can accept is £2, and we allow on all deposits 5% per annum, and execute orders from the amount by wire or letter immediately.

We have sent out several small articles, amounting in some cases to perhaps 10s. or 15s., to oblige our customers, and, in some cases, have never received remittances, therefore we have been obliged to adopt this method in order to despatch goods immediately upon receipt of letter or wire.

MAUDE'S MOTOR MART.

Behaviour of Rubber Belts in Wet Weather.

[3348.]—*Re* "Ixion's" comment in the last issue of *The Motor Cycle* anent the slipping of rubber belts in wet weather. Last winter I fitted a certain ⅞in. canvas and rubber belt to my tricar, and though it had to contend with all sorts of vile samples of this climate—rain and snow—that belt never showed the slightest inclination to slip except when very slack. This belt lasted over 1,000 miles.

The next one of the same make pulled well enough until the least wet was encountered, when the free-wheel business would begin, and all one could do was to watch the belt race through the pulley, progress being out of the question. One day I took off the belt and reversed it, when, behold! it held like a vice through two whole days of pouring rain. But that belt came to an untimely end right there; the rubber skinned off in all directions, leaving the fabric bare. I ran about 400 miles with that belt. Since that time I have had pulley skimmed out, and both pulley and belt rim are now of perfectly correct angle. Being unable to get a leather belt at short notice, I fitted my old friend the canvas and rubber again, feeling sure that with a correct pulley and new belt my troubles would cease; but alas for disappointed hopes! No sooner did I cross the freshly-watered tramlines, when coming home after a 134 miles run, than the belt commenced to slip as badly as ever. Comment is needless; mine, at the time, unprintable! AE 241.

Unattached Riders.

[3349.]—I was pleased to see that at last the A.C.U. is going to make some attempt to attach the non-club motor cyclists in this country, who number at least 40,000 men. I am afraid, however, that it is too late in the field. Both the M.U. and the C.T.C. have for some weeks been endeavouring to attach us to their organisations. If, however, the A.C.U. work hard and notify through your columns at once that it is prepared to take non-attached motor cyclists as associates at a fee of 5s. each, most of us who have been in the past associated with the N.C.U. and the C.T.C. (of ten and twenty years ago) will only be too glad to join an organisation which is in being to devote its attention entirely to the interests of motor cyclists as apart from pedal cyclists or motor car owners.

CHARLES S. PATTERSON, M.B., M.R.C.S.

[We regret to say that since the publication of the leaderette referred to by Dr. Patterson we learn that the A.C.U. Executive has gone no further than to refer this most important matter to the Relations Sub-committee. This sub-committee has no power to do more than make suggestions, and, from what we can hear, is not expected to deal with the question in a too energetic manner. In the meantime, local organisations are ready to accept unattached riders as associate members at 5s. per head; only 2s. of that fee goes to the A.C.U., so the local clubs ought soon to be on a profit-making basis.—ED.]

[3350.]—Since the A.C.U. has apparently no intention of catering direct for the unattached rider, the letter from Mr. Cove loses some of its points. At the same time, it is doubtful to see what facilities the average rider stands to gain by joining the A.C.U. over any local club. I should like to point out my idea of the advantages of direct membership outlined by Mr. Cove:

ADVANTAGES.	
Free copy of *R.A.C. Journal* (6d. to non-members).	Ninety-nine per cent. of the reading matter and advertisements appeal to car owners only.
Right to carry A.C.U. badge.	I have only seen one fitted, and with the jumble of initial letters I took it to be a personal monogram plate.
Use of club rooms.	Useless to country and provincial members.
Touring facilities.	The A.C.U. has nothing to offer in home touring facilities such as reduction in hotel bills. The motor cyclist objects to pay car tariff.
Free legal advice.	An affiliated association includes this in its 5s. scheme.

It appears to me as if the club or association that offers such facilities for a moderate subscription—say 5s.—will get the chief support from unattached riders. D 1617.

Dust Coats should Not be Too Long.

[3351.]—Having seen a great number of motor cyclists wearing *long* dust coats of light but strong material, I at last succumbed to the temptation and—to my sorrow—bought one. This article nearly caused a bad accident, as may be easily understood when I state that one side was suddenly gripped by the back wheel near the hub, and slowly but surely wound me off the machine, which incidentally was of 5 h.p., and undergoing a speed test. A word of warning to those who may be possessors of such garments, or who are anticipating the purchase of one, may be of use.

MISPLACED.

Courtesy at the Shows.

[3352.]—The subject of courtesy at the shows has lately figured largely in your Correspondence columns, and in a recent issue "Briton" numbers among the discourteous some of the firms advertising in your columns.

His remarks as applying to the majority are, I fear, only too true, but at last one of our English firms deserves, I think, to be mentioned as a brilliant exception. I refer to the Rex Motor Co. Some weeks ago I asked them to build me a special machine, offering my present mount in part payment. They agreed to put the work in hand at once. My specification included several variations from their standard model, and I even wrote them once or twice to make additions and alterations, but every letter of mine has been answered with such prompt attention and courtesy, and this during one of their busiest seasons, I feel my dealings with them have been a pleasure. H. A. Y. HEATHCOTE.

Sidecars.

[3353.]—With reference to "Hints and Tips for Motor Cyclists" now appearing in *The Motor Cycle*, I should be much obliged if you would kindly publish my experience, as I do not agree with one or two remarks on sidecars (No. 214) and side-slip (No. 215). I have not had or felt the slightest sign of a side-slip with my Castor wheel sidecar, and I have given it some severe trials, as I have been out in all weathers with light and also with heavy passengers, and have ridden on roads which slope down towards the kerb a good deal on days when roads were greasy. Mounting from the left side comes quite natural after one or two rides. The rider should see that the right-hand side pedal is at its lowest point before he pushes off, and directly he finds the machine is going all right he should step on to the pedal, and mount the saddle. If the road is fairly level, or better still a down gradient, one can mount and get comfortable before the machine is started, as one or two turns of the pedals will usually start the machine. My wife is over eleven and myself thirteen stones, and we get about a good deal and never have any trouble as to starting, etc. The machine is a 3½ h.p. Triumph, and the sidecar a Mills and Fulford. This combination takes us up almost all the hills in this district (Birmingham), and I seldom have to pedal to assist. I can climb up Gorcott and Meriden hills in Warwickshire without pedalling with a lightweight passenger, but with one over nine and a half stones I generally have to assist slightly.

W. C. SMART.

Air-cooling.

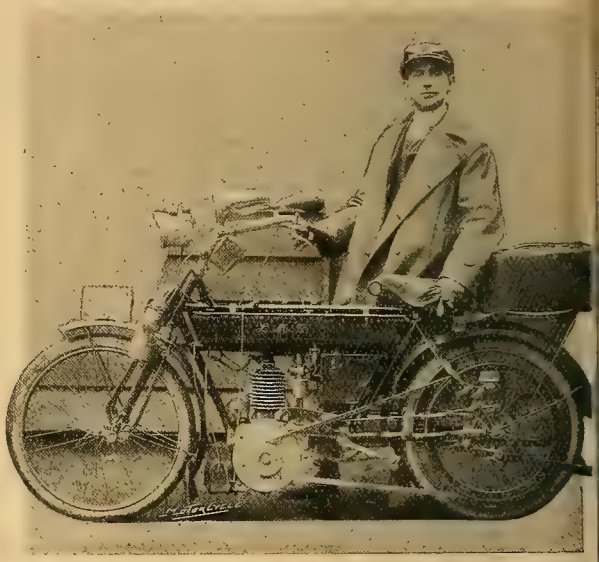
[3354.]—Your correspondent "Scotia" is quite right when he says that in the discussion under this head, and under the subject of overheating, the principal question of moment has been overlooked. I agree with him that the air-cooled engine is very inefficient indeed when compared with the water-cooled engine, according to any basis of comparison except those of weight and of cost.

To my mind the question is of absolutely prime importance when we consider the real advancement of the whole motor industry. Without the restrictions of weight and of cost anyone can turn out a thoroughly reliable and comfortable touring car, but when it comes to a question of producing a vehicle that shall be reliable, cheap, light, and efficient, the whole energy of the most experienced engineer must be brought to bear, and the most ideal production must be the true lightweight motor bicycle capable of producing the greatest horse-power per lb., whilst not forgetting the essentials of comfort, reliability, and so forth.

It is a perfectly well-known fact that for given cylinder dimensions the water-cooled engine gives far more power than the air-cooled, and the reasons are not far to seek. The degree of compression common enough in water-cooled engines is far above that which is possible for air-cooled engines. It is just because in a sense the air-cooled engine "overheats" that a low compression must be used in order to prevent pre-ignition. It is, further, just because the air-cooled engine "overheats" that it cannot take in the cylinder as great a weight of fuel and air per stroke as a water-cooled engine of the same dimensions.

It is well-known now that the temperature of the cylinder walls which will yield maximum efficiency is far below that of air-cooled engines as generally built and used.

I trust that I shall not be credited with any wish to decry the air-cooled engine in any other respect than may



Mr. Reginald Samson with his 3½ h.p. L.M.C. Motor Bicycle. This machine—fully equipped with luggage bag, two Rogers detachable air tubes in pouch on handlebar, tin of carbide strapped to front forks, full kit of tools and spares in metal tool case,—obtained a non-stop certificate in the last A.C.U. Quarterly Trials. Stripped of its touring equipment, the same machine made fastest time at the Birmingham M.C.C. hill climb at Rose Hill on May 2nd.

be done with the object of developing something better, fo the simplicity of its construction is, I believe, bound to kee it as high in the estimation of users as it now stands, but ther are ways in which improvement will be effected, and w must all wish to see them in practical form as soon a possible. The gap between inefficient air-cooling and ponde ous water-cooling is far too wide, and we badly want a com promise. How is this to be brought about? Many of u have ideas, and most recognise their cash value at thei true worth—*nil*. I have some hope that radiator system may be carried out whereby the heat of the cylinder will b transferred to the radiator proper through the medium c volatile liquids evaporated in the cylinder head, the vapour cooled in the separate radiator, and the condensed liqui falling back to the cylinder head. It is at any rate difficul to imagine anything much lighter and simpler as a com promise against water cooling by the usual cumbrous means There is no novelty in the system, and it is far more likely t be experimented upon by the makers of motor cycle engine than by the makers of car engines, who really do no object to an extra 20 lbs. weight so long as it saves ther the trouble of trying anything new.

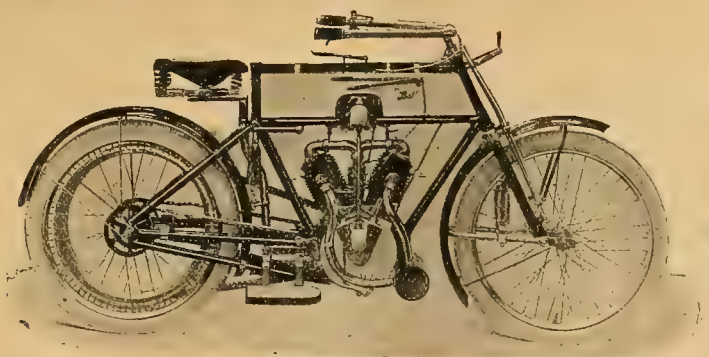
J. H. LESTER, M.Sc., F.I.C.

THE PRICE OF TRIUMPHS.

The Triumph Cycle Co. write us in reference to advertise ments that have appeared from time to time in this journa offering Triumph motor cycles at less than catalogue price They ask us to draw the attention of the public to the fac that a new Triumph motor bicycle embodying all the im provements of the year cannot be bought under the catalogu price, and a contract is entered into with all their agent not to undercut.

"My machine, I am glad to say, is going beautifully. I never knew how comfort and speed could be combined till I got this machine from you."

An owner:
D. G HIND,
Sussex.



"I must say I have nothing but praise for the machine. I have had six machines during the last few years, but have never had one to come up to this. I have just had a week round the Welsh mountains and have ridden them all with ease."

Another owner:
L. L. FARRINGTON,
Evesham.

JAP ENGINES. STILL THERE. **6-7 & 7-9 h.p.**

The "BAT" with the SPRING FRAME

and the **SPRING FORKS** still occupies its position **ON TOP**—the position to which it is admitted to be fully entitled, by reason of its **luxurious comfort**, the comfort of a Pullman, and its **reliability**, the reliability of a locomotive. Why not send for our Illustrated List, free on request.

The BAT Motor Manufacturing Co., Penge, London, S.E.

WINNERS
USE THE
"WATAWATA."

Speed tests call for a maximum of power, and for the right direction of that power. The Watawata is so constructed as to admit of no wastage, whilst its bull-dog tenacity brings out the highest capabilities of your engine. The winner of the Motor Cycle Handicap Plate at Brooklands on May 9th, used a Watawata, his machine being of only $2\frac{3}{4}$ h.p.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

EPR

Accumulators

should be specified when ordering your new 1908 mount.

They contain all the latest improvements in storage battery construction. Our new list will tell you why "E.P.R." cells are now so generally used. It will also save your money. A post card will bring you a copy by next post.

¶ What about your present accumulator? Why discard it and throw away money? Better send it up to us, and we will make it as good as new for about half of the cost of a new cell. We could send you letters received from clients all over the country, expressing absolute confidence and great satisfaction with the way we have dealt with their repairs.

¶ AGAIN. What about your present accumulator? Not worth repairing? Well, again we say, don't discard it. We take old cells in part payment for new "E.P.R." guaranteed accumulators. ONLY, please note this, our prices are fixed as low as can be consistent with good material and first-class workmanship. WE DO NOT CHARGE YOU A HIGH price for a new accumulator, and then allow you an inflated price for your old cell. Our prices are low, and the allowances we make for old cells are actual market value.

¶ We have specialised in accumulators since 1902, so you get the benefit of our experience.

P.S. DON'T forget to post that car! to night.

Richford and Co.

(Dept. M4),

ACCUMULATOR SPECIALISTS,

And at 52a, HIGH HOLBORN, W.C.

Established 1876.

CARS FOR SALE.

8-10 h.p. Four-cylinder Humber, swing seat side entrance body, Cape cart hood, folding wind screen, Stepney wheel, luggage grid and box, four lamps, upholstery and paintwork quite good; subject to any trial; £145.—T. Baker and Sons, 37, Friar Street, Reading.

ROVER Cars. — We have in stock for immediate delivery an 8 h.p. four-seated car, swing front seat entrance, painted Rover green, and upholstered in red leather, 1908 model; price £235.—Louis Davis and Son, Moseley, Birmingham.

ROVER Cars are acknowledged to be the most reliable car made. For the professional man, the business man, and the man on pleasure bent it offers an ideal and convenient means of travel. Read the harrowing experiences on motor cycle and tricars given in *The Motor Cycle*, and you will realise exactly what we mean when we say you can make an appointment and rely on getting there.

THE Price of the two-seated 6 h.p. Rover is £135, costs less in upkeep than a tricar of the same power, and is much easier to drive. We are prepared to make you a good allowance for your present machine in exchange, or supply on deferred payments. — Louis Davis and Son, Moseley, Birmingham.

HOTELS AND APARTMENTS.

WHEN Visiting London stay at Waverley Temperance Hotel, 17, Euston Square. Bed, breakfast, attendance from 3s.

GARAGES.

BRIGHTON.—Black Lion Garage, back of Sea View Hotel, Black Lion Street, fifth turning from Aquarium on right, along front; specially for motor cyclists; repairs on Sundays.

INSURANCE.

HUGH J. BOSWELL, Insurance Broker, Norwich, issues all classes of policies for motor cycles at lowest possible rates; inclusive policy, 20s.; fire insurance only 2s. 6d. for £25, or 3s. 6d. for £35.—Write for particulars.

LOST AND FOUND.

LOST, Sunday, between Staines Bridge and Hampton Court, an inner tube, enclosed in pink and white duster; anybody returning will be rewarded.—13, *The Motor Cycle* Offices, Coventry.

SITUATIONS VACANT.

ENGINEER Wanted, with small connection, to share motor works; rent free. —Write, P. Dowton, 207, Peckham Rye.

SITUATIONS WANTED.

YOUTH seeks situation as Junior-Salesman or otherwise, good knowledge motor cycles.—No. L2,499, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

GENTLEMAN desires partnership in motor and cycle business, workshop training, and electrical experience, willing to help work up business.—22, *The Motor Cycle* Offices, Coventry.

BUSINESSES FOR SALE.

FOR Sale, owner going abroad, low price for quick sale, motor and cycle business; latter can be discontinued if desired; old-established, on Brighton Road; lease contains valuable building extension agreement; certain opportunity. — Box 20, *The Motor Cycle* Offices, Coventry.

ACCUMULATORS.

TWO Fuller's Accumulators, 16 amp., 4½in. by 3in. by 3in., new, charged once; 10s. 6d. each, cost 16s.—W. Searle, 4, Crampton Road, Penge.

CELLULOID Accumulator Repair Outfits, useful for all celluloid repairs; full directions; post free, 1s.—Osborne Works, Forest Hill, London.

ACCUMULATORS Repaired promptly, any make; reasonable charges, best work; estimates given; full value for your old accumulator in exchange for our new "Mayfair" accumulators; special 15 amp., 10s. 6d.; 20 amp., 15s.; guaranteed one year.—Fellows, 49, Hertford Street, Mayfair.

ACCUMULATORS.

ACCUMULATORS.—8s. and your old accumulator secures a brand new Premier accumulator, fully guaranteed, not German trash.—Farrar, Square Road, Halifax.

THE Famous Ajax Accumulator, absolutely the finest it is possible to make (see advertisement in spring No. *The Motor Cycle*) specially protected terminals, 20 amp. size, will run 2,000 miles with Voltoo coil; Voltoo coils work on two volts; extremely economical and efficient; send for lists.—Ajax Electrical Engineering Co., 291, High Road, Ilford.

COUPLINGS.

UNITO Cycle Coupling, for connecting any ordinary pedal cycle to motor cycle.

THE Unito connects the steering and ensures faultless alignment.

THE Unito is so constructed that side strain and lean of machines is entirely obviated.

THE Unito is adjustable to accommodate differences in wheelbase and wheel and frame dimensions.

DON'T Buy a Sidecar before you know the advantage of having a

UNITO Coupling. It only costs one guinea.—Write, Dept. B., Unito Coupling Co., Ystrad, Glam.

ENGINES.

4-5 h.p. Simms Engine, M.O.V., water-cooled, quite new, and fitted high tension magneto; £11.—Farrar.

2½ h.p. Quadrant Engine Sets, cylinder, piston, connecting rod, crankcases, flywheels, exhaust valve, 37s. 6d. per set; 3 h.p. Quadrant sets, as above, 45s. set.—Farrar.

2¾ h.p. King Engine, vertical, fitted contact breaker, driving pulley, good puller; £3.—Farrar.

3¼ h.p. De Dion Pattern Engine, fine condition; £3 10s.—Farrar.

3½ h.p. Standard Engine, vertical, will take trailer up most hills; £3 15s. — Farrar.

3¼ h.p. Quadrant, 1907, new, perfect; £4 10s.—Farrar, Square Road, Halifax.

1½ h.p. Minerva Engine, with carburetter and coil; 35s.—35, Dover Road, Wanstead Park.

GIVAUDAN Twin Engine, and N.S.U. two-speed gear fitted to engine-shaft; £4 10s.; run 400 miles.—Goss, Great Colmore Street, Birmingham.

3½ h.p. Genuine De Dion Bouton water-cooled engine, cylinder, 80 by 85, Longuemare carburetter; £8 10s.—Apply, Ebron, Walton, Aylesbury.

2½ h.p. Buchet Engine, silencer brand new, £3 10s.; Chater-Lea plain coil, 7s.; trembler coil, 8s. — Wyatt, 11, Neal Street, Long Acre, London, W.C.

5 h.p. Twin Bercley engine, gear driven magneto, perfect, little used, £12; also pair F.N. spring forks, 30s.—G. Hall, 26, Oxford Road, Waterloo, Liverpool.

ENGINES.—Zedel, 2¾ h.p., £7 13s.; 3½ h.p., £9 0s. 10d.; 3½ h.p. twin, £10 0s. 7d.; 5½ h.p. twin, £13 12s.; all models in stock.—Rey, 5, Heath Street Motor Works, Hampstead.

3½-4 h.p. Twin Peugeot Engine, complete, in fine condition, £8; twin trembler Bassee-Michel coil, cost 50s., take 25s.; warranted good.—215a, Gloucester Road, Bristol.

3½ h.p. Centaur, M.O.V., with carburetter, silencer, complete, replacing with twin, £4 10s.; also coil, Guenet, trembler, accumulator, will sell lot for £5.—McHugh, Carluke.

TYRES.

FARRAR.—New inner tubes, fully guaranteed, not porous rubbish; 26 by 2, 7s.; 26 by 2¼, 7s. 6d.; 28 by 2, 7s. 6d.

FARRAR.—Tyres, fully guaranteed; 26 by 2, 16s.; 26 by 2¼, 17s. 6d.; 28 by 2, 16s. 6d.; 24in. same price.

FARRAR.—Tremendous stock Continental tyres; your old tyre accepted in exchange; list free. — Farrar, Square Road, Halifax.

PALMER, 26 by 2¼, fitted Grose band, unused, perfectly new; 45s.—Paxman, Tewkesbury.

Reg. No. 291289.
2/6 each Rivet.
Contacts vastly superior to platinum, cures misfiring.
Any parts fitted by return of post.

MAGNETO SCREWS, Complete, to fit BOSCH MAGNETO D.A. 2. Old pattern short screws, or new pattern long screw and nut, 5/6 pair. NO TROUBLE. EVERLASTING WEAR. Post free home or abroad. Write for particulars and testimonials, too numerous to publish.

J. EDWARDS-BROWN, 38, Herbert Road, PLUMSTEAD KENT.
Over 5 000 in use. Liberal trade terms.
Old Magneto Screws refitted, 2/6 each.

COMPRESSION

Cylinders Rebored

Standard Machines in Competition.

IN connection with open hill-climbing competitions and other open events which are so popular with motor cyclists, we think it is time some move was made to obtain for the benefit of the large majority of riders some more interesting data to go upon than is usually provided by the bare results on time or on formula. For instance, it would provide a considerable amount of genuine excitement if the organisers of an open event of any kind would intimate to manufacturers that they had been bold enough to appoint a sub-committee to select the machines from their stock on which their trade competitors could compete, and that these machines would be selected haphazard two or three days before the event and sealed. This would give sufficient time to tune up and get the machine into the normal condition in which it is delivered to a customer. It would be fitted with standard tyres, wheels, engine, and other parts, and would be a fair representation of the manufacturer's ordinary weekly output.

At present it is, unfortunately, rather the rule than the exception, particularly in hill-climbs where pure speed tells and weight is a great consideration, for trade riders to use special machines. No one will blame them if it can be done without protest, but a win on a special machine is not fair to others. Why not a special class for special machines?

Competitions, except local events which are confined to club members, are held partly for sport and partly to improve the breed. In some cases we are led to understand that they are organised entirely for the latter purpose. Then why should it be possible in such cases to use the same machines time after time and year after year, particularly when, as in some cases, the machines differ entirely from the standard patterns sold to the public.

There can be no improvement of the breed in such cases as are cited above, particularly when the weight is cut down to the absolutely lowest margin and machines are ridden which would not be suitable for ordinary touring conditions.

It is a matter of surprise to us that the officials at some of these events do not insist on machines being ridden which conform more closely to the standard articles sold to the public. It is not sufficient to propound a regulation that machines must be similar in detail to those sold to the public; it should be insisted on.

Town-to-town Records.

WE notice with regret that there is a tendency to gain advertisement out of town-to-town records on motor cycles, and we hope those responsible for the organisation of such performances will refrain from further exploits of this nature. Motor cycles are gradually but surely gaining popularity, many thousands ride them now, and many thousands more will do so every year, but it would be very regrettable if scorching between towns should cause restrictive legislation, as it undoubtedly will do if indulged in to any extent.

No record worthy of the name can be established without causing some inconvenience to other road users, and possibly danger. Against reliability runs like the A.C.U. End-to-end, where a reasonable speed is seldom, if ever, exceeded, or even the classical End-to-end record, we have nothing to say, because the

average speed is not excessive; but in regard to town-to-town records we desire our readers to clearly understand that in future we do not intend our pages to be used for the publicity of such events. Up to the present no harm has been done, and record-breakers have been few and far between, but it is the keen rivalry that ensues when record-breakers commence to pile up performances on different makes of machines that is likely to cause trouble.

We do not deny that we have given publicity in a certain form to long-distance rides while they were accomplished at what is practically touring speed, but now there are signs of the legal limit being greatly exceeded we have serious thoughts of refusing to devote any space whatever to anything of the kind again. However, we hope we shall not be called upon to do so, and that riders who wish to follow the path to glory, and makers and agents who assist them, will see that in letting short-distance road records severely alone they are studying the best interests of the pastime.

A.C.U. Sutton Bank Hill Climb. F. Applebee, jun. (5 h.p. Rex), using his foot as a pivot to assist him in rounding the bad corner.

THE 9 h.p. J.A.P. ENGINE.

SOME remarks have been overheard recently to the effect that a machine fitted with a 9 h.p. J.A.P. engine is a totally impracticable mount on account of the large cubical capacity of the engine. On a recent Saturday a 9 h.p. twin Bat with J.A.P. engine, rigid frame, and dual ignition, was seen at the Hut, Wisley. On this machine the ignition arrangements attracted special attention, the contact-breaker for the accumulator system being carried on an extension of the magneto shaft, while the coil was carried in a metal case on the front forks. The gas was generated in one of the new J.A.P. spray carburetters, which was so well adjusted that the rider was able to *walk* beside the machine with the engine firing. If such flexibility and smooth running can be obtained with so large an engine, it seems not only absurd but unfair that people who have not tried the machine should criticise it so adversely.

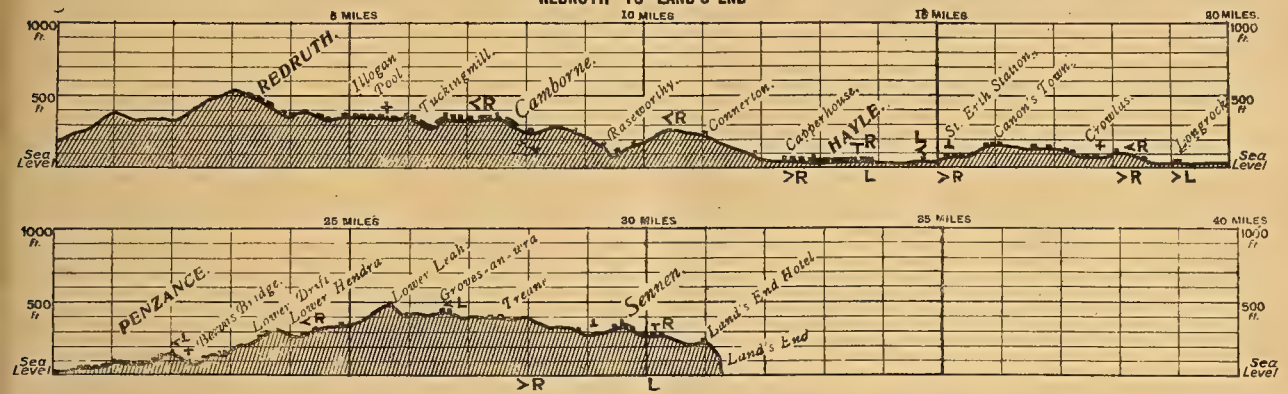
We do not recommend such high horse-power as a general rule, but if expert riders care to purchase a machine of this size we really cannot see why they should not. In fact, to dispel any ideas that there may be existent about the impracticability of one of these machines, we have arranged a trial run to take place shortly, when we may have an opportunity of criticising the machine from actual road experience.

At Saragossa (Spain), in the motor cycle race for the Centenaire prize, the three first arrivals rode machines fitted with Gaulois tyres.

The A.C.U. End-to-end Trial.

CONTOUR SECTIONS OF THE MOST DIFFICULT PORTIONS OF THE ROUTE.

REDRUTH TO LAND'S END



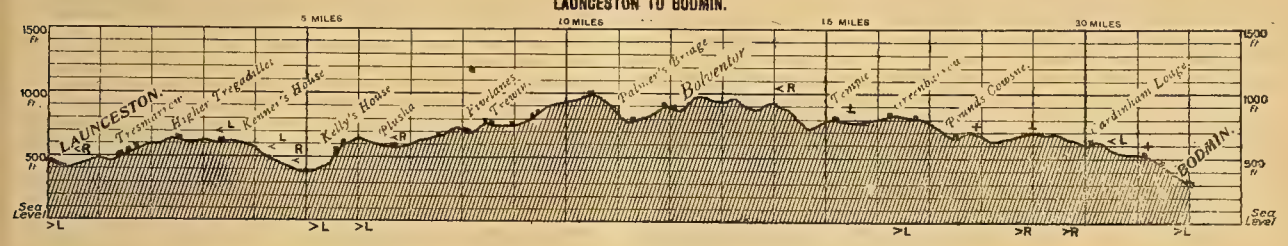
From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS (†*Dangerous*).—At ¾m. 1 in 17; 4¾m. 1 in 13†; 5¾m. 1 in 19; 8¾m. 1 in 17; 11½m. 1 in 16; 14¾m. 1 in 18; 21m. 1 in 17; 27m., 27½m., and 27½m. 1 in 15; 28m. and 28½m. 1 in 10†; 30½m. and 30¾m. 1 in 14.

This, the start of the ride, is hilly, and consists of a series of short sharp ascents and descents varying in length and steepness. Near to Penzance there is a dangerous descent of 1 in 10. From Penzance to Hayle there is a magnificent surface. In the neighbourhood of Hayle the road is lumpy, and continues hilly through Camborne to Redruth. 27 miles.

After leaving Redruth the road branches to the left near Scorrier Gate Station, and is very undulating with fine surface to Zelah, thence poor to Mitchell, and good to Blue Anchor. The road then continues with few gradients of any steepness to Bodmin, where there are several rather severe gradients. 57 miles. *(The contours should be read from right to left.)*

LAUNCESTON TO BODMIN.

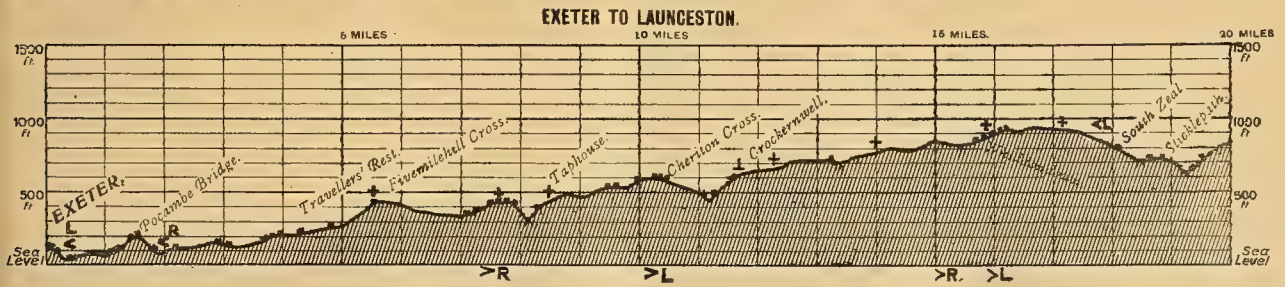


From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS.— 4m. 1 in 19; 5½m. 1 in 16; 8¾m. 1 in 17; 11m. 1 in 12 (dangerous); 11⅝m. and 12¼m. 1 in 13; 14¼m. 1 in 17; 17½m. and 21½m. 1 in 13.

From Bodmin to Launceston the road is exceedingly hilly and rough in places; it goes over Bodmin Moor, and attains an altitude of 1,000 feet above sea level. The steepest gradient is about 1 in 12, that being near Bolventor. Launceston, 79 miles. *(The contour should be read from right to left.)*

EXETER TO LAUNCESTON.

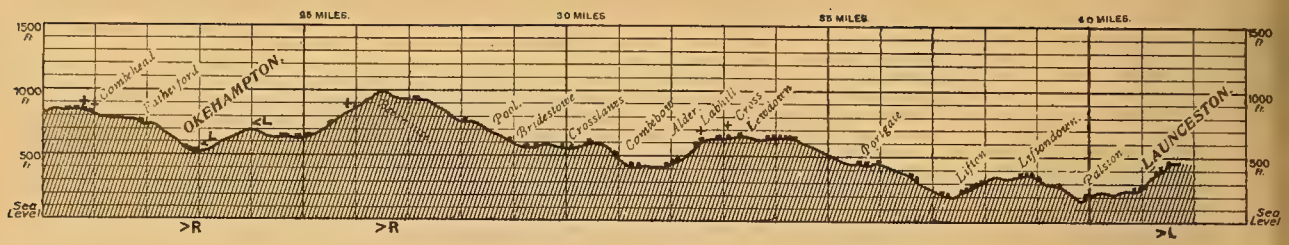


From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS.—At ½m. 1 in 16; 1½m. and 1¾m. 1 in 11 (dangerous); 5¾m. 1 in 13; 8m. 1 in 15; 8¼m. 1 in 14; 11m. 1 in 15; 11½m. 1 in 14; 15m., 16m., and 18¼m. 1 in 17; 19¼m. and 19½m. 1 in 19.

This portion skirts the famous Dartmoor Forest, and has an excellent surface. There are, however, very many stiff to dangerous hills; gradients of 1 in 11 and 1 in 13 frequently occur. The most trying rise is one of three miles, from 500 to 1,000 feet above sea level, starting at Bridestowe. Exeter, 120½ miles.

The road after Exeter becomes easier, and the famous old coach road from Exeter to Bristol *viâ* Cullompton, Wellington, and Taunton is entered upon. There are few hills, and the surface is excellent. Owing to the density of traffic and the innumerable tramlines that infest the city of Bristol, it is a difficult place to get through; a good deal of tramline can be avoided by going over Clifton Down.

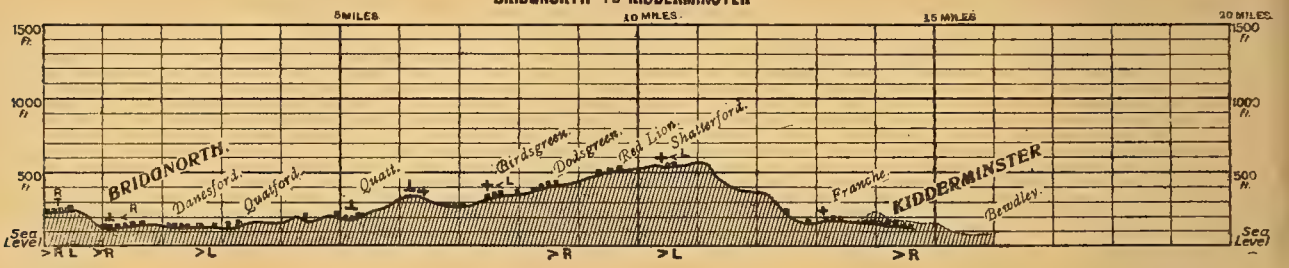


From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS.—22½m. 1 in 17; 23½m. 1 in 20; 24½m. 1 in 17; 25½m. 1 in 15; 29m. 1 in 19; 31m. 1 in 14; 32½m. 1 in 17; 35m. 1 in 23; 36½m 1 in 17; 37¾m. 1 in 19; 39¾m. and 41¼m. 1 in 13.

The road from Bristol to Gloucester is very good indeed—in fact, all the way to Birmingham, but at Worcester the record route branches off to Ombersley and Kidderminster. Here there are one or two sharp pitches. Kidderminster, 271¼ miles. *(Contours should be read from right to left.)*

BRIDGNORTH TO KIDDERMINSTER



From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS († *Dangerous*).—At 1m. 1 in 12; 1¾m. 1 in 16; 3½m. and 4m. 1 in 15; 4¼m. and 6m. 1 in 16; 7¼m. 1 in 22; 11½m. 1 in 17; 12½m. 1 in 12†.

After Kidderminster there is a steep hill between Franche and Shatterford, which rises for nearly two miles, and requires a powerful machine to negotiate it owing to the bends. The surface is good, but this section is more or less hilly all the way to Bridgnorth. 284¾ miles.

From Bridgnorth to Wellington the road is not level, but there are few hills of any consequence, except the long rise from Madeley to Lawley Bank, averaging about 1 in 30. After Wellington the country is flat through Whitchurch, Tarporley, and Warrington to Wigan, 364½ miles. Preston, 381¾ miles, and Lancaster, 403¼ miles; after Preston there are one or two hills on the way to Kendal, 424½ miles, and then begins the pull over Shap, with a long run down on the other side. The summit of Shap is about 1,400 feet above the sea. The road continues through Penrith to Carlisle, 469 miles. *(Contours should be read from right to left.)*

(To be continued.)

R. M. Brice (3½ h.p. Brown) starting in the Sutton Bank Hill Climb, May 30th. He won Class II., for machines with engines not exceeding 82 mm. bore.

OCCASIONAL COMMENTS.

By "IXION."

The Twin-cylinder Puzzle.

The owner of a 6 h.p. Jap engine writes to tell me he has experienced precisely the difficulty I detailed on page 333, and remedied it entirely by tilting his carburetter slightly on the frame, so as to raise the level of the petrol in the jet, the engine promptly returning to smooth and cool running with full power.

A Smart Accessory.

Readers will remember my saying last year until we were given a compartment in the tank wherein to carry our acetylene generators, the only good position for it was on a tongue bracket cast integrally with the front clip, securing the tank to the top tube of the cycle. I have received such a clip, embodying a tongue bracket for the generator, from the Advance Motor Company, Northampton, and they inform me they also make a pattern with tongue at each end, so that two generators can be snugly carried one on each side, like holsters. This device should interest the night-riding fraternity, and more especially any who have End-to-end or London to Plymouth aspirations. The clips are slotted for the tank screws, and provided with a setscrew pressing on the top tube, so that they will fit practically any cycle on the market without alteration.

Diagnosis.

An experienced motorist of my acquaintance was bewildered by the chronic misbehaviour of his engine during a recent run. He could find nothing wrong, although he knew the machine by heart, and yet it would do everything except fire regularly and powerfully, and he finally abandoned all attempts to solve the mystery by the roadside, and made the best of his way home. It then transpired that when he had asked his younger brother to fill the petrol tank that morning, a can had been used which had been opened for ten months. Not only had it been open, but its contents had been poured into a pannikin whenever a cleaning job was on, and had become well diluted with oilwater and filth, till they were more like peasoup than petrol. None the less the engine both ran and pulled on the nauseous mixture. This is highly to the credit of the carburetter used.

Petrol Filters.

I see very few machines fitted with petrol filters, and there is no doubt they are well worth their cost to any rider not afflicted with the microbe of tinkeritis. I personally enjoy taking down my carburetter every thousand miles or so, but the majority of riders do not, and dirty petrol and inefficient funnels are a feature of every long ride. End-to-end entrants would do well to employ petrol filters. In 1906 several riders had as many as six stops in a day from choked jets alone, and the carburetters are not yet exclusively fitted with separately detachable jets, nor does the detachable jet quite cover the difficulty, as if there is a teaspoonful of mud in the float chamber the jet will need cleaning again in a few miles, and it is not constructed to be hurriedly unscrewed by a bad-tempered man seven times in a day, as I have found to my cost before now. I don't know how it is, but, though I invariably use a finely screened funnel to fill the tank through, the catchpot of my filter always contains a goodly assortment of rubbish when I examine it.

Belt Fasteners.

Overhauling my stock of spares and accessories on a wet day recently, I dug out some two dozen belt fasteners of various sizes, shapes, and patterns, and so fell to moralising on what a perfect belt fastener should be. Ideally I must say there is nothing to touch the Watawata common wood screw; you can get it anywhere, it costs nothing, it's the easiest to put in or take out, and it does not create a stiff patch in the belt. But no other belt lends itself to this, and the commonest type is that now standard for rubber belts. Among my collection are samples cracked across the jaws, and samples cracked across the hook; samples with stripped threads; others buckled out of shape, others worn right through at the link, and so forth. Out of my reflections I evolve the following desiderata for such a fastener:

1. Loose link (*i.e.*, hook joint, not permanent link).
2. Broad bearing for hook.
3. Thick endplates of good tensile strength, to avoid cracking, and to give room for plenty of screw threads.

(4. If for use with adjustable pulley, it should be adjustable so as to correct belt length.)

Wanted, a Front Wheel Stand.

With so many energetic accessory firms working the market for all it is worth one scarcely expects to find obvious gaps, and I think the absence of a front wheel stand is simply due to the comparative rarity of front wheel punctures. Without such a stand the repair of such a puncture is not easily accomplished. You extract the portion of tube where the puncture is from the cover and mend it; if the whole of the beaded edge has not been taken out you can turn the wheel till that part of the tyre which has both lips still in the rim is next the ground, and the rest of the job will be quite safe. But if all of the beaded edge has to come out of the rim before the hole is located you are confronted by a dilemma; either you must replace part of the cover with the tube uninflated, or else you must blow the tube up partially and let the weight of the cycle rest upon it while it is not corseted by the cover. Neither alternative is safe. My own plan is wherever possible to find a stone and lay it under the crank case so as to lift the front wheel clear of the ground. Failing this, I begin by replacing ten or twelve inches of the cover, and turn the wheel till this part of the cover rests on the ground; I then put the usual few pumpfuls of air in the tube, replace the rest of the cover, put in a little more air, turn the wheel round, and test the ten or twelve inches of cover first inserted for nipping. But the fact remains a front tyre repair is far more comfortably and easily accomplished with the aid of a stand.

A spare air tube carrier introduced by the Premier Motor Co., Ltd. Before placing in the carrier, the tube should be coiled up compactly in flannel or baize; it is then free from chafing.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

The Vagaries of the Police.

I started on a slope with clutch out and was summoned for driving a motor to public danger. Now the engine had not fired once (and P.C. admitted it), and I might as well have been riding a push bicycle. Why should my license have been endorsed?—A.P.C.

The ways of the police are strange and wonderful, and we are not surprised to hear that the magistrates have endorsed your license. On conviction, according to the Act, your license may be endorsed for any offence you commit.

Four-cylinder Motor Bicycles.

(1.) Please say if there are any other well-known makes of four-cylinder motor bicycles besides the F.N. and Durkopp? (2.) Who is the English agent for the Durkopp machines? (3.) Are four-cylinder machines satisfactory, especially as regards wear? (4.) Are they made with a magneto? —R.H., Aldershot.

(1.) We do not know of any, the F.N. is the best known. (2.) The agents for the Durkopp machines are the Service Motor Co., 292, High Holborn, W.C. (3.) The latest patterns of the F.N. four-cylinder machines are quite satisfactory in every way. (4.) Magneto ignition is fitted.

Knocking in Engine.

I am riding a 1907 3½ h.p. Triumph motor bicycle, and it knocks very badly. Could you tell me why? I have just put in a new piston ring, and it stops dead after running a few miles. Do you think the ring is too tight, as my engine gets very hot? I am using Wilburine oil for the engine, and had a new fibre ring fitted and carburetter cleaned. The cylinder and piston head are quite clean, also the plug and contact breaker.—C.A., Yorks.

If you have fitted a new piston ring probably it is too tight a fit and is causing trouble. It would be best to take the engine down and see if there is any play in the gudgeon pin or the crank pin. Some machines are slightly more inclined to knock than others, but the knocking may often be cured by keeping the spark fairly well advanced, and by shutting off the air when the knocking begins.

Water Circulation on Tricar.

Will you please tell me if the thermo-syphon circulation on my Humber tricar is correct? The hot water from top of cylinder jacket enters bottom of water tank, and runs through a tube to within an inch of top of tank, so that when the water is 2in. down I cannot see how there will be a syphon. It makes a lot of steam. Will it not work better if this tube is taken out so that the water will enter at the bottom of water tank?—J.H.

The circulation system is correctly arranged, but unless the water covers the top of the delivery pipe the circulation will not work, and special care must be taken to see that it is covered. Probably you will find that if you increase the length of the gilled tubing and fit a larger tank the engine will keep cooler.

Deposit in Water Pipes. Lubrication of Gear and Engine.

(1.) Is there a compound sold to prevent deposit in water jackets? Would sal ammoniac do? Is this chemical injurious to copper or castiron? (2.) What lubricant is best for the Roc clutch and speed gear fitted to the Rex Litette? How often should it be oiled? (3.) How often does the engine on this tricar (water-cooled) require a pumpful of oil?—H.H.B.

(1.) Various compounds are sold to prevent deposit in water jackets, etc. To thoroughly scour out water jackets there is nothing better than a strong solution of washing soda. (2.) Grease is best for variable gears, as oil has a habit of finding its way out and bespattering every part of the machine. Refill every 250 miles or so. (3.) Every five miles and oftener if the low gear is being used a good deal.

A.C.U. Hill Climb. The winner of Class III., J. Marshall (3½ h.p. Triumph), on his upward flight.

Improving Compression.

Having ridden my new machine for over 1,000 miles I want to remove the cylinder to scrape away the carbon deposits. At the same time, as the compression is slightly weaker, I propose grinding in the exhaust valve. Kindly tell me how to proceed?—NOVICE.

To remove the cylinder first study the maker's catalogue, as by removing certain parts it is generally possible to take off the cylinder, leaving the remainder of the engine in the frame. To grind in the exhaust valve provide yourself with some flour emery and lubricating oil, a long screwdriver, and a ball of waste to put in the cylinder to prevent any of the emery falling inside and doing damage. Tie a piece of string around the waste, and when grinding operations are completed withdraw the waste, and any traces of emery should come away also. Obviously, this is only necessary when the valves are ground in without removing the cylinder. It will, of course, be necessary to remove the spring and cotter, then smear the valve seating with a little emery and oil. Insert the screwdriver through the valve cap in the slot provided in valve head, and work the valve backwards and forwards under pressure, occasionally lifting the valve to prevent scoring. The grinding should be continued until all traces of pitted marks have disappeared.

Attention to Engine after 800 Miles.

I have now covered some 800 miles on my 1908 magneto motor bicycle without trouble, and should be glad to know what attention to it is now necessary. There is only a slight falling off in power, and I think this will be restored when I have removed the cylinder and scraped away the carbon deposits. The only thing I have done to the machine at present is to shorten belt (twice) and draw off the oil every 300 miles and inject clean oil.—S.E., Derbyshire.

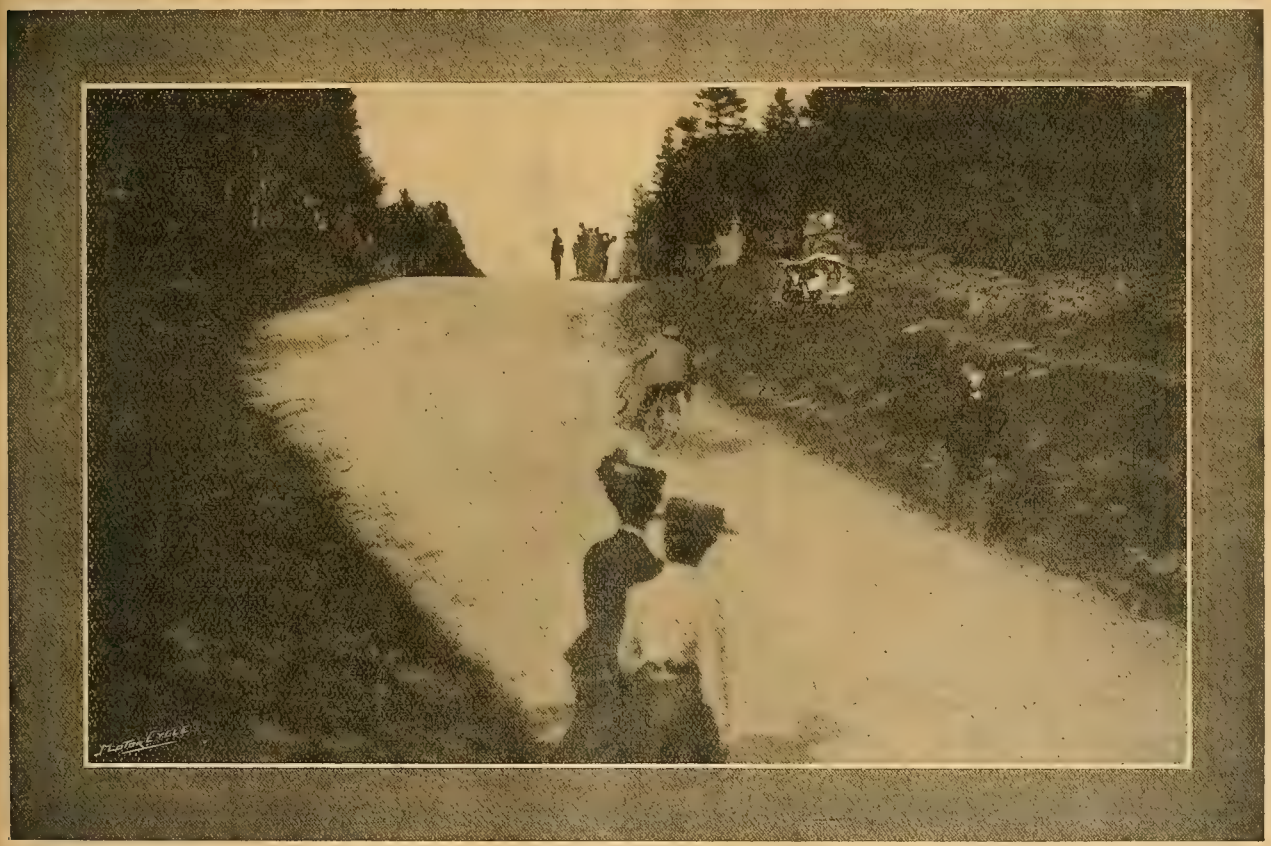
After 800 miles it is necessary to scrape away all carbon deposits, and if the compression has become weaker grind the exhaust valve on to its seating. The crank chamber should also be swilled out with paraffin. Empty all the oil out of the crank chamber, disconnect the lubrication pipe, put an eggcupful of paraffin into the crankcase, and let the machine stand overnight. Next morning pedal vigorously with the exhaust valve raised, then open the drain tap and repeat the operation until the paraffin runs out clean. Then put four charges of oil in the crank chamber and start up the engine. The magneto oil reservoirs should be drained and also swilled with paraffin. The carburetter passages, spray, and feed pipe should also be thoroughly cleaned. If the platinum contacts of the magneto are black and pitted, use a fine file to trim them and remove any traces of oil.

READERS' REPLIES.

With reference to "J.F.M.'s" query as to restoring life to an engine, I have in my possession an identical machine which developed similar defects. On close examination I found as the chief cause of the trouble the insufficient lift of the valves. Remedy, use caps between valves and tappets. The magneto on the 4 h.p. Antoine is generally the low tension type by Gerard, and which in "J.F.M.'s" case probably wants rebushing.—F.M., St. John's.

Re answer to "S.H.," Herefordshire. I had a case of misfiring on a Minerva which was due to the twisting handle control. The handle had pulled the screw a little bit out from the inside of the handle-bar, and consequently there was not a perfect electric communication between the insulated screw and the metal handle-bar. Another case was due to the cam of the make and break working loose on the pinion.—P.S.W.

I notice in a recent issue one of your readers suggests taking out the gudgeon pin setscrews, reducing the length of the gudgeon pin at each end, and fitting copper washers in the recesses so made. I should like to point out that I did that twice to a machine I had, with the same result in each case, viz., that the gudgeon pin, although a tight fit when inserted, worked loose, and necessitated a new piston in less than 300 miles.—C.M.



The gradient of Sutton Bank, near Thirsk, averages 1 in 9 for nearly one mile. This photograph, showing J. Scriven topping the hill on a twin Rex, conveys an excellent impression of the severity of the last portion of the climb.

Another view of the hairpin corner, half-way up Sutton Bank. It proved the undoing of several of the competitors.

A WORD OF ADVICE.

NOW that long distance police traps are being worked in Sussex and other counties, motor cyclists will do well to study their maps carefully, so as to find roads running parallel to the main roads which are totally free from police interference. Many a pleasant day may be spent in discovering new roads, but care should be taken to consult previously a map upon which the roads are accurately and clearly marked. The importance of this was impressed upon us the other day when trying to discover a new road to the south coast. The map before us showed a road which ran directly to within a few miles of the sea. After some difficulty, an excellent and exceedingly pretty road was found, but, at the point where it met the downs, the road suddenly disappeared altogether and ended in a mere cart track with deep ruts. Just before this point, however, a good main road was found leading to a well-known seaside resort nine miles away. Had a good map been consulted, the mistake would not have been made, as, on referring to the Ordnance Surveys of Brighton and District, sheets 88 and 97, scale two miles to the inch (which may be obtained from most booksellers or from the Ordnance Survey Offices, Southampton), the exact spot where the macadam ends and the grass track begins is clearly shown. For obvious reasons we shall not publish any of these roads in *The Motor Cycle*, but we should recommend motor cyclists to look out for them themselves, and this they will undoubtedly find to be worth their while.

cene at the foot of Sutton Bank, Yorkshire, on the occasion of the A.C.U. Open Hill Climb, on the 30th ult.

"GOODRICH"!

Trade Mark.
QUALITY.

THAT'S THE TYRE

THE ORIGINAL ALL RUBBER NON-SKID.

MANUFACTURED BY THE
B.F.Goodrich Co.,
7, SNOW HILL,
LONDON, E.C.

Supplied by all Dealers Everywhere.

FOR THE FIRST TIME

since we introduced this tyre on to the market

WE ARE NOW ABLE TO DELIVER FROM STOCK.

Customers who have been disappointed in delivery will please accept this intimation as an apology for previous delays, as

WE WERE UNABLE TO FORECAST SO IMMEDIATE A SUCCESS AND SO LARGE A DEMAND.

"Simply Incomparable."

Enagh Manse, Ballymoney, Co. Antrim, 27th February, 1908.

"I have just heard of Mr. F. Newton's wonderful performance on Palmer Cord Tyres. It proves these to be on cars just what I have found them on a motor cycle—simply incomparable.

"I ride all days and in all weathers, and tyre troubles were the bane of my life till I got Palmer's Cords. Now I can ride for months without re-inflating.

"I feel it only due to give you this little bit of my experience, and wish you success.

Signed (Rev.) J. RAMSEY."

Whether for Cycle, Motor Cycle, or Motor,

PALMERS

are "simply incomparable." This all-round excellence is, of course, due to their sound construction on scientific principles.

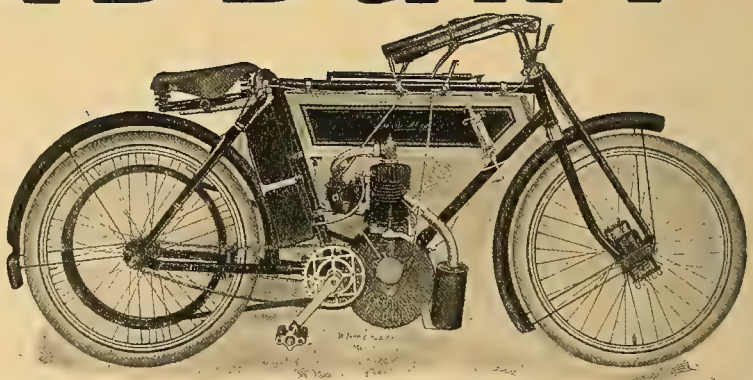
Write for our Manual, gratis and post free.

THE PALMER TYRE LTD., Shaftesbury Avenue, LONDON, W.C.

BRADBURY

We claim the following advantages over motors of any other type.

Powerful Vertical Engine. Strongest Pattern Frame with all Straight Tubing. Engine Case forms basis of Frame. Perfect and Permanent Alignment. Long Bearings of Phosphor Bronze. Mechanism easily accessible. It runs smoothly and quietly, and every Engine gives its advertised power. Less Vibration than any other Motor of same power. The Best Hill Climber. Perfect Balance.



AWARDED 17 GOLD MEDALS IN RELIABILITY TRIALS.

2¼ h.p., £25; 3 h.p., £32; 3½ h.p., with spring fork attachment, £40.
4½ h.p. Motor Fore Car, open frame, water cooled, two speeds, free engine £85.

PRICE LIST AND NAME OF NEAREST AGENT ON APPLICATION TO DEPARTMENT M.

Bradbury & Co., Ltd., WELLINGTON WORKS, Oldham.

Being the opinions of medical men who are actual or prospective users of motor cycles.

(*Continued from page 399.*)

W. H. Moorhouse, B.A., M.D. (London, Ont., Canada.

Although I have read your very interesting journal, *The Motor Cycle*, for the past two or three years, I have never been a user of the motor cycle, as they have not yet come into common use in our country, but from what I have been able to read and hear I think they must be a source of great pleasure and enjoyment to the users. I am expecting to take a trip to your country in the near future, when I shall look more carefully into the matter and make a selection.

W. Winterville, M.D.

(1.) I consider motor cycling an eminently healthy pastime. (2.) I find it of the greatest service (more particularly from May to November) in rapidly, and with a minimum of fatigue, getting from place to place in the discharge of my professional duties. (3.) The cost per mile I believe to be less than that of any other mode of locomotion except walking and pedal cycling, with, of course, much saving of time and labour as compared with these.

A Newark Doctor.

A Newark doctor writes: (1.) I warmly advocate motor cycling, as not only is it healthy for one's body, but the care needed in keeping the machine efficient is a hobby which acts as a relaxation from business, etc. (2.) I have owned a car, and last year I rode a Triumph and ran four thousand five hundred miles. I had one puncture and no mechanical stops. I sold it in January, 1908, and bought another Triumph. I use my motor cycle in all weathers and at night. The only drawback is mud in winter, causing one's legs to get dirty. (3.) I keep a horse and groom for town work, which costs £180 a year. The motor cycle does ten times the distance, and costs approximately £26 a year. (4.) 3½ h.p. magneto most certainly, low built, and handle-bar control because of skidding when hands are off handles. Any h.p. above this is not so easy to handle. For winter a considerably lower gear is required, 5 to 1 or even 5½ to 1, as speed is not required and freedom from skidding is.

Dr. T. B. P. Wilkinson, whose opinions were given on page 353 of May 6th.

H. J. Walker, M.R.C.S., L.R.C.P.

Having had four years' experience with motor cycles, first of all with two bicycles, and for the last twelve months with a tricar (Phœnix-Minerva), I have come to the conclusion that there is no sport to equal it for a doctor because he is so easily able to get into the country and away from his surroundings, which not only invigorates the body but the mind also. I do not consider motor cycling fit for professional work in towns, but should think in the country it is a great boon to doctors, and even then should recommend a tricar with a water-cooled engine. As a sport I consider motor cycling inexpensive if one starts with a good machine and understands how to look after it.

J. A. Manton, M.R.C.S., L.R.C.P., etc.

(1.) Employed with average commonsense motor cycling is a splendid sport and health-giving pastime. (2.) In bad weather horse and trap still essential, but if roads are decent the saving of time is very large indeed. I work an extremely wide-spreading round in a very hilly district. (3.) Cost infinitesimal as compared with motor cars, and a fraction of the cost of horse and trap. (4.) Heavy machines are useless to a doctor. Patients object to perspiration, gymnastics, and dirt. Heavyweights useless to middle-aged men, to whom the risk of heart strain is very serious. I am middle-aged, and I've tried cars, tricars, motor tricycles, etc., etc., and heavy-weight motor cycles in vain. I find a Motosacoche with spring fork almost perfection. If an extra half horse could be got in the same weight, which is, of course, asking a lot, it would be absolute perfection. As it is, it will go anywhere uphill or down hill, but occasionally requires light pedal assistance.

Stephen G. Longworth.

From six years' experience of motor cycling in its various forms I believe it to be healthful. I have found it an excellent promoter of appetite and sleep, and *par excellence* as a means of blowing away mental cobwebs. My work having been for some years confined to an institution, I use my machine chiefly for recreation, but from a limited experience of general practice I most certainly decide in favour of the three-wheeler, something on the lines of that in the accompanying photograph, and for the following reasons: Stability, ease of starting, moderate speed, two-speed gear, belt drive, comfort, and protection from mud, necessitating no special clothing.

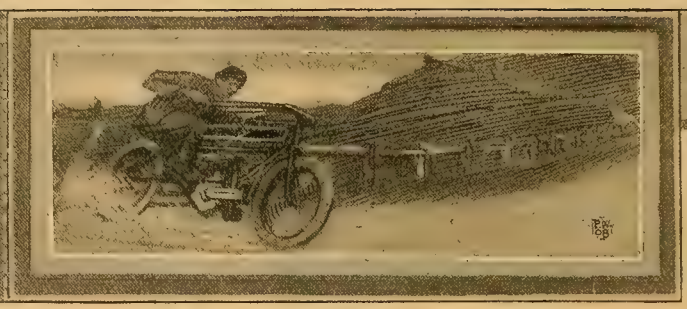
Dr. S. G. Longworth

Norman Hughes, M.R.C.S., L.R.C.P.

(1.) From a health point of view there is nothing more invigorating than a sharp spin through the air on a good motor cycle. You are compelled to fully expand the lungs by filling them with fresh air; it makes one alert, observant, and creates a healthy appetite. (2.) To a country practitioner, who is strong and young, a motor cycle is indispensable as a speedy, efficient, and economical means of getting round his practice. (3.) Horse and trap and man cost at least 28s. per week. My motor cycle expenses run me at 2s. 6d. per week, including petrol, oil, and repairs. Depreciation in value would be the same as in horse and trap. (4.) A reliable 3 to 3½ h.p., gear about 5 to 1, magneto, weight about 150 lbs. The 1908 Triumph embodies my ideal.

(To be continued.)

CURRENT CHAT.



Special Features

M.C.C. London-Edinburgh 24 Hours' Run (Fully Illustrated).

Contour Sections of the A.C.U. End-to-end Trials.

A Trap in Warwickshire.

We are advised of a new police trap halfway between Banbury and Southam.

Police Trap at Darlington.

Several well-known North country motor cyclists were fined a few days ago for covering a short-measured stretch in Darlington at speeds of nineteen and twenty miles an hour.

The M.C.C. Team Competition.

Everything points to this year's competition for *The Motor Cycle* Challenge Cup being even a greater success than in previous years. Eight clubs have already expressed their intention of entering a team to compete for the trophy. We should strongly advise secretaries of clubs to get their teams together without delay, as the organisers inform us that it is just possible that if there is a sudden rush at the last moment, entries will have to be refused owing to lack of accommodation at Daventry and difficulty in organisation. The Motor Cycling Club is anxious to make the affair successful, and would like to receive definite entries immediately, even if the names of the members forming the team are sent in a little later. The name and address of the Trials hon. secretary is Mr. J. Van Hooydonk, Spring Villa, High Road, North Finchley, N.

Red-hot News.

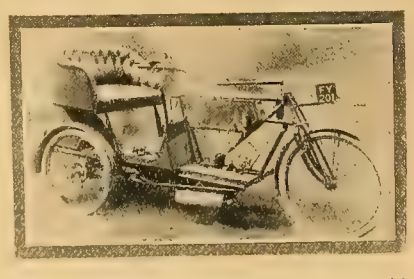
A correspondent who prefers to remain anonymous informs us that some days ago a few motor cyclists were discussing the overheating question. One of them stated that he possessed some years ago a certain make of engine, the cylinder of which occasionally got so hot that the piston could be seen moving up and down owing to the transparency produced by the red hot iron. No one seemed to believe him.

The Second Race Meeting at the Stadium.

We have to announce that on June 13th, at 3 p.m., an athletic meeting will be held by the Essex Beagles at the Stadium, Shepherd's Bush. The list of events now before us includes one motor cycle race, placed at the end of the meeting. It seems a great pity that whenever an athletic meeting is held the motor cycle event is always placed at the very end, when most of the people have gone away, and only a few enthusiasts remain. That is what happened on the occasion of the first meeting at the Stadium last month, when we commented strongly upon the treatment of motor cycle events. Motor cycle racing is a draw at a race meeting, and should be accorded a better position in the programmes.

A Passenger Motor Cycle.

The photograph reproduced herewith depicts a tricycle with seats side by side owned by Dr. A. A. Bradburne, of Southport. The engine is a 4 h.p. air-cooled Antoine. The transmission is by chain, and there are two speeds actuated by a clutch and a hand lever working a dog clutch. There are two band brakes on the back wheels operated by foot and hand lever, and also a front rim brake. We are told that the machine has proved very satisfactory, and will climb most hills on the low gear. Its top speed is about thirty miles per hour.



FUTURE EVENTS.

June 13—Essex Beagles Ten Miles Motor Cycle Handicap at the Stadium.
" 20—Entries close for M.C.C. Team Competition at Daventry.
" 20—Barnsley Victoria C.C. (Motor Section) Open Hill-climb for Motor Cycles.
" 24—London United Tramways Five Miles Tourist Motor Cycle Handicap at the Stadium.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective Competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., Liverpool M.C., North West London M.C.C., and Sheffield and Hallamshire M.C.C.
" 27—Motor Cycle Union of Ireland Inter-centre Contest for the Triumph Cup.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 6-7—A.C.F. Grand Prix Races for Cars.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
" 25—Motor Cycling Club Petrol Consumption Tests.
Aug. 8—Essex M.C. Open Race Meeting at the Stadium.

Petrol Spirit in One Gallon Tins.

Why the large wholesale petrol merchants and refiners do not send out sealed tins containing one gallon as well as two gallons of spirit we cannot understand. The smaller cans would very often be of great service to motor cyclists, as retailers frequently refuse to open a tin to supply less than two gallons. Tins of this size would be welcomed by motor cyclists.

An Unsuccessful Action.

A provincial journalist, Arthur W. Jarrett, of Willans, near Tiverton, was last week summoned at the Cullompton Police Court by Charles Hutchings, labourer, of Silverton, for riding a motor cycle in a dangerous manner on the highway. Defendant pleaded not guilty. Complainant stated that he met a motor lorry on a narrow road, and the defendant, who was coming behind the engine, failed to allow him to pass the lorry first. The result was that all three met and passed each other at the same time, and he (complainant) was obliged to run into the hedge. Defendant said he had ridden a motor cycle for five years, and he submitted that this was an unnecessary and vexatious prosecution, and to call it a motor offence was a misnomer. It was impossible for him to give the defendant more room than he did, and he did not see the complainant until he came out from behind the lorry. He could not pedal backwards, and he dared not stop. The magistrates dismissed the case.

Oxford v. Cambridge Motor Cyclists.

The inter-varsity hill-climbing competition which was to have been held at Sharpenhoe Hill on the 30th ult. cannot take place, as the County Council of Bedfordshire has refused the necessary permission.

A Strange Request.

We often receive strange requests which are difficult to comply with, but we have never been asked before to establish agencies in England for a well-known make of motor car. Such a request, however, has just reached us in the form of a circular letter addressed to the Editor, *The Motor Cycle*, London. This explains that owing to the American crisis the Léon-Bollée firm are compelled to extend, the United States and France having previously absorbed the output.

M.C.C. London to Edinburgh Run.

Mr. S. F. Edge, who for the first time did not assist in starting the men at Highgate, was absent through pressure of business, and his place was taken by Mr. G. F. Sharp.

An Enterprising Firm.

The Gaslight Improvement Co., Ltd., the vendors of the well-known Carburine motor spirit, had a van load of petrol at Highgate, and another van with fuel on board at Edinburgh, in the early hours of Monday morning.

The Ever-present Trap.

Through the courtesy of a correspondent *The Motor Cycle* was able to warn the competitors of a trap in the Morpeth district.

Low Numbers for Motor Cycles.

We are informed by the London County Council that all numbers under 3,000 of the new L.C.C. registration letters are reserved for motor cycles.

A.C.U. Land's End to John-o'-Groat's Trial.

The time fixed for this event, July 13th to 18th, is drawing near, and entrants are making their final arrangements to enable them to compete. It is hoped that all who intend to take part in this trial will carefully read the conditions beforehand; for instance, the question of the use of cut-outs has been raised, but it distinctly states on page 8 of the preliminary regulations that "no cut-outs are to be used, and, if fitted to the machine, they must be closed and sealed so that they cannot be used." The following entries have been received up to the present: W. H. Wells, 5 h.p. Vindec Special; Walter Ridler, 6 h.p. Leader; E. Nelson, 5 h.p. Rex; J. Tassell, 3½ h.p. Matchless; Gordon Gibson, 3½ h.p. Triumph; F. Dover, 3½ h.p. Triumph; F. S. Barnwell, 3½ h.p. Rex; Dr. H. R. Mayo, 5 h.p. Vindec Special; I. B. Hart-Davies, 3½ h.p. Triumph; M. Geiger, 6 h.p. N.S.U.; T. F. Cox, 7-8 h.p. Minerva; W. H. Bashall, 3½ h.p. Triumph; M. W. Randall, 10 h.p. Lagonda tricar; F. C. Mustard and C. E. Murphy, 3½ h.p. Triumphs.

The M.C.C. Membership.

The Motor Cycling Club now heads the list of social motor cycling clubs with a membership of 274. A rapid increase in the membership during the last few weeks is, of course, due to the London to Edinburgh twenty-four hours' run, which has once more proved to be a most successful event despite the difficulty of handling large numbers.

Whit Monday Racing at St. Albans.

The five miles invitation handicap race was won by D. R. Clarke (2¾ h.p. Century-Givaudan), A. Tyler (2 h.p. Chater-Lea) being second, and J. Smyth (2¾ h.p. Rex) third. Time, 7m. 25s. Five entered for the five miles touring machine handicap, C. Reid (3 h.p. Century) finishing first, and S. Collier (3 h.p. Century) second. Time, 7m. 44s. Result of the five miles invitation scratch race.—1, H. V. Colver (2¾ h.p. Matchless); 2, D. R. Clarke (2¾ h.p. Century); 3, J. Smyth (2¾ h.p. Rex). Time, 6m. 22⅖s.

Echoes of Sutton Bank.

Owing to the length of the course and the numerous turnings which it contained, one or two errors have unfortunately crept into our report of the hill-climb held at Sutton Bank on the 3rd inst. Mr. W. E. Grange informs us that his 3½ h.p. Triumph climbed the hill successfully, whereas it was stated in our report that he had dismounted. In Classes 5 and 6, Mr. F. Scriven's name is unfortunately given in place of that of his brother, Mr. Jack Scriven. R. G. Bell, the rider of the Moto-Rêve, did not dismount at the corner—he unfortunately fell. Bell was travelling at a good speed at the corner, but when negotiating it the back wheel of the machine skidded from under him. Considering that the machine had the smallest engine of all those competing, the fact that it got as far as the corner is a point distinctly in its favour. In Class 2 the difference between R. M. Brice (3½ h.p. Brown) and F. Scriven (3½ h.p. Rex) should have been 30⅕s., not 3⅖s.; the latter was a misprint.

St. John's C.M. & A.C.

The results of the two motor cycle races at Tunbridge Wells on Whit-Monday, promoted by the above association, were:

Three miles scratch race.—1, C. E. Bennett (Mansfield 76 by 73); 2, F. E. Barker (Rex 75 by 75); 3, H. Martin (J.A.P. 85 by 60). Time, 4m. 56s.

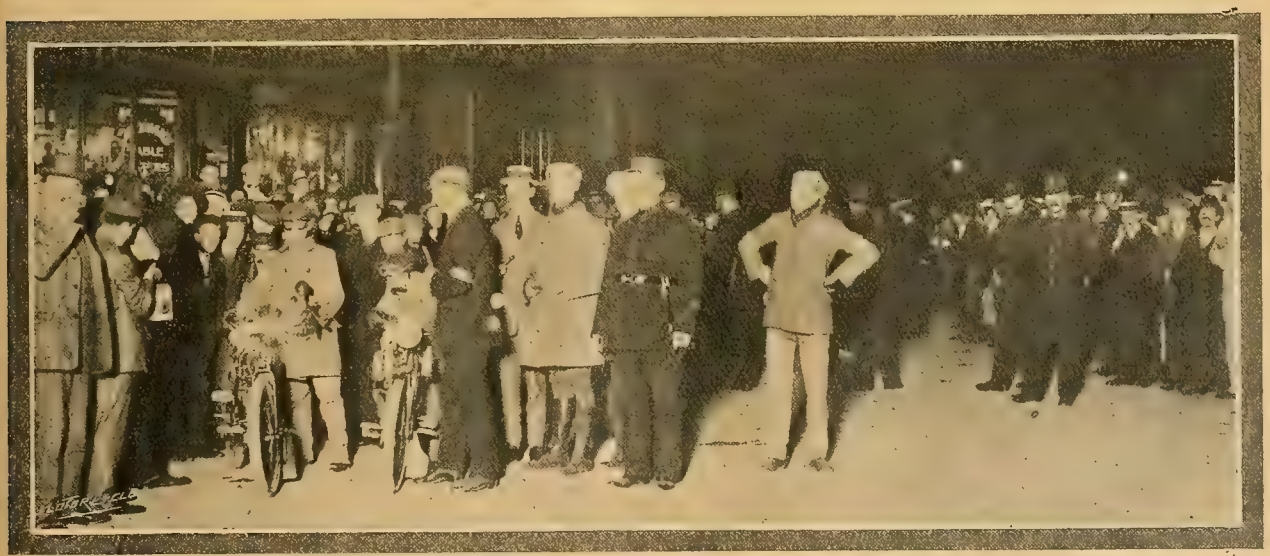
Five miles handicap (handicapper F. Straight, A.C.U.)—1, A. White (Dart 70 by 86); 2, H. Martin (J.A.P. 85 by 60); 3, F. E. Barker (Rex 75 by 75). Won easily amid loud applause. Time, 7m. 48⅗s.

Barnes versus Olieslagers.

On Thursday evening of last week Geo. A. Barnes, mounted on his new 14 h.p. Peugeot racer, met Olieslagers on the Velodrome Buffalo, Paris. Barnes beat the Belgian at his own speciality—quick starting—and quickly assumed a twenty yards lead, but not having had any track racing experience for eighteen months, he was at a disadvantage; moreover, he is not yet able to get the best out of his new racer. Olieslagers won the race by about thirty yards. The rivals have now met on two occasions, and a win stands to the credit of each.

International Auto Cycle T.T. Race.

There is every probability that the International Auto Cycle Tourist Trophy Race will be held before the end of September, instead of October, as originally suggested, and intending entrants will be well advised to get their machines in Tourist Trophy trim without delay. They will thus have plenty of time in which to practise, so that they may be able to get the best speed on the quantity of fuel allowed, which will this year be as follows: Single-cylinders, one gallon per 100 miles; multi-cylinders, one gallon per eighty miles. The entries received up to the present are: H. Collier and Sons, Matchless (1); H. Rem Fowler, Norton (1); Triumph Cycle Co., Ltd., Triumph (3); T. H. Tessier, Bat (1); W. H. Wells, Vindec Special (1); and Robert W. Ellis (1).



Flashlight photograph of the start of the London-Edinburgh ride. Nos. 1 and 2—S. G. Frost and S. Webb—waiting for the word to go.

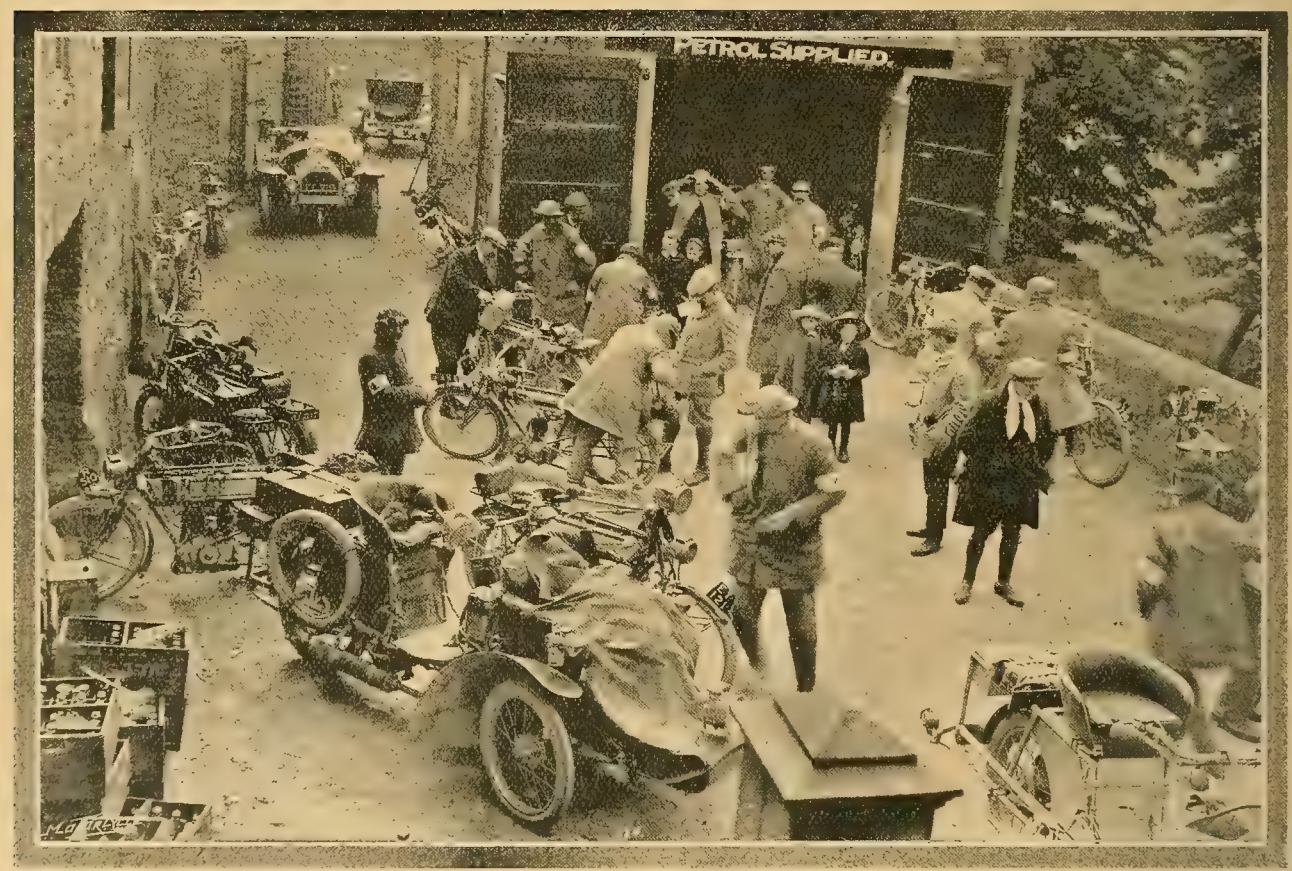
The M.C.C. London to Edinburgh Run.

IN the whole history of motor cycling there is nothing more remarkable than the ever-increasing popularity of this splendid competition, which year by year is better supported. Last week the number of motor cycle entries amounted to 106, of which ninety-nine were motor bicycles and seven passenger motor cycles, thus eclipsing all previous records. The fine open space in front of the Gatehouse Hotel, Highgate, presented the usual busy scene as the hands of the clock approached 10 p.m., and despite the large crowd of spectators and the numerous throng of competitors, the officials changed confusion into order with astonishing celerity. All the motor bicycles were placed on the right hand side of the road, and the passenger motor cycles and cars on the opposite, all the competing machines being arranged in their numerical order ready to fall into line as the starter, Mr. F. T. Bidlake, and the marshal required. A cool evening with the wind in the North-west, a bright crescent-shaped moon and a clear sky boded a fine passage for the riders, but near the time appointed for getting under way black clouds began to gather to windward, and the sky became gradually overcast. Leaving Highgate shortly before the first man was due to start we made our way to Biggleswade, which marks the completion of the first stage of the journey. Even at this epoch in the history of motoring the journey from London to Edinburgh is to be considered no light one. Four hundred miles separate the two capitals, and in twenty-four hours this space must be covered, man and machine must alike be fit to accomplish half of the greatest length of this island of ours in the time allotted for the purpose.

The first event of any importance was the meeting of a patch of unrolled metal, near Barnet, marked by an illuminated danger sign, and with the roller and its accessories hung with lamps. Here everyone had a fair warning of the approach of danger, but not so further on. Just outside the chief hotel in Hatfield lay a dangerous patch of unrolled stones, of which someone might have easily warned the riders. Near Baldock also as one approaches the town down a long descent another even worse patch was encountered, which caused the downfall of more than one rider. Shortly after leaving the town the night became very dark, and near Biggleswade spots of rain fell, and gradually developed into a downpour. On the route cards the following words come after the name Biggleswade "Check (no need to dismount)," which implies that a competitor may do so if he please, and who would not who has once sampled the excellent hot coffee and sandwiches made ready in the cheery Swan Hotel, where we found the first competitor who had passed us on the road.

Close on midnight came Sale, followed by others, and for the next hour men came in thick and fast, demanding petrol and sandwiches, coffee and carbide, water for their lamps, and lubricating oil all in the same breath. Imagine that quiet, orderly, and sober town, all ablaze with headlights of a crowd of fifty competitors at once—a scene which must be seen to be realised. For one solid hour continuous streams of riders poured in, all enthusiastic despite the rain now pouring down upon them, and relating to one another the terrors of that patch of stones at Baldock. Williamson, the present holder of the End-to-end record, was one of the victims, and R. C. Davies, who arrived very late, was another. Troubles at this early stage were, of course, few and far between, but one or two men had to struggle with their lamps, of whom one failed to get a light until he put the water he had forgotten into the generator.

The competing machines represented almost every known make of motor cycle. Several machines made their début in open competition on this occasion—the 4½ h.p. A.S.L., ridden by Mr. A. Sharp, fitted with a 4½ h.p. Jap engine, and possessing a distinctly novel feature for a motor bicycle,



In the hotel yard at Wetherby, preparing for the third stage of the run.

The M.C.C. London to Edinburgh Run.—

namely, a pressure fed Jap carburetter; the machine was also suspended fore and aft on Sharp's patent air springs. The other débutant was Mr. Chater Lea's carette.

Gunn, who has done the "hat trick" in this competition, made the journey this time on a new Lagonda car.

By 2.30 most of the men had gone by, and had started to cover the second stage of the journey to Grantham and breakfast. The rain still fell, and the night was cold, but the men bravely forged ahead in the teeth of the wind and driving rain to meet the fine weather that was shortly to come. Tempsford Bridge, set at right angles to the road, had to be negotiated, where men waving lamps indicated the danger. Eaton Socon, Buckden (where the road to Huntingdon is nearly always taken by mistake, despite adequate warning, even by men who have made the journey several times), and Alconbury (which boasts of the only hill between Biggleswade and Stilton) are then passed. Here daylight, cessation of the rain, and a cold, breezy morning, not quite neglected by sunshine, cheer on the men, who, as the light grows stronger, increase their pace and speed along the road, growing straighter and less thronged with villages, until Grantham is reached and the second stage is over.

Of the competitors, T. J. Weightman had sparking plug trouble, and was much delayed. S. T. A. Oldfield had to retire owing to a broken carbon brush in his magneto and a broken fork spring. Mundy, the last man to send in his entry, was reported to have suffered a puncture and a clogged up free-wheel. Rumours of other troubles were reported, and one man was said to have found himself in a ditch. Through Norman Cross a Motosacoche and Moto-Rêve were seen travelling in excellent style. Below we give the names of the riders and their machines who checked at Biggleswade:

MOTOR BICYCLES.

*S. G. Frost (4½ Minerva)
S. Webb (3½ Triumph)
C. G. Myer (9 Bat)
W. H. Wells (5 Vindec)
*J. S. Harwood (3½ Triumph)
W. H. Lane (3½ Triumph)
H. G. Cove (2 Moto-Rêve)
F. Mussell (3½ Quadrant)
*A. G. Reynolds (3½ Vindec)
W. A. Sale (5 Vindec)
G. E. Roberts (3½ Triumph)
A. M. Tatham (3½ Matchless)
*E. Gwynne (3½ Vindec)
A. de S. Hutton (6 Premo)
A. D. Draper (3½ Matchless)
V. Olsson (5 Vindec Special)
*L. A. Baddeley (3 Baddeley)
A. D. Nicholson (3½ Triumph)
G. W. Raper (6 N.S.U.)
J. S. Tweddle (3¾ N.S.U.)
*T. F. Cox (7-8 Minerva)
C. J. Seed (5 Vindec Special)
R. M. Brice (3½ Brown)
H. C. Horswill (3½ Brown)
*H. Williamson (3½ Rex)
S. Oldfield (3½ Quadrant)
H. Collins (3½ Norvic)
H. M. Bentley (3½ Triumph)
*C. H. Crole-Rees (6 Advance)
W. O. Bentley (3½ Bell)
J. T. Weightman (3½ N.S.U.)
P. H. Trotman (3½ Triumph)
*F. White (5 Rex)
H. G. Bell (3½ Triumph)
G. Brough (3½ Brough)
B. Cumberland (3½ Triumph)
*W. A. Jacobs (3½ Rex)
Miss Muriel Hind (5 Rex)
H. S. Myer (3½ Rex)
Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ Triumph)
*J. Le Grand (2½ Matchless)
J. L. Barratt (5-6 Peugeot)
D. S. Baddeley (5 Baddeley)
I. Hart-Davies (3½ Triumph)
*G. L. Fletcher (2 Moto-Rêve)
R. C. Davies (6 Griffon)
H. G. R. Slingo (5½-6 Griffon)
A. J. Sproston (5 Vindec)
*W. Pershke (4 Diamond)
J. Stuart-White (1¾ Motosacoche)
J. V. Robinson (1¾ Motosacoche)
*A. S. Phillips (5 Vindec)
E. Pond (5 Vindec Special)
G. Gibson (3½ Triumph)
A. H. Forbes (3½ Triumph)
*O. L. Summers (3½ Vindec)
C. C. Cook (3½ Triumph)
A. McDonald (3½ Triumph)
A. Peppercorn (2¾ Anglian)
*R. O. Clark (5 F.N.)
M. Campbell (5 Vindec)
Dr. Moss-Blundell (3½ Z.L.)
W. H. Bashall (3½ Triumph)
*H. P. Beasley (5 Rex)
H. C. Sayer (3½ Triumph)
J. Cooper (3½ Triumph)
A. Walton (5 Vindec Special)
*A. Sharp (4½ A.S.L.)
C. F. Lacey (3½ Fafnir)
A. T. Browett (3½ Triumph)
V. H. Deucher (5 Vindec)
*J. O. M. Dixon (3½ Vindec)
P. C. Campariole (3½ ——)
G. Rowden (3½ Bat)
W. H. Bishop (3½ Vindec)
*C. E. Woodger (5 Eland)
H. C. Haûriott (3½ Triumph)
H. Cowlin (3 Triumph)
A. Jelks (3 Chase)
*J. Winslow (5 Rex)
P. E. Quick (3½ Triumph)
S. H. Clay (4½ Minerva)
*O. C. Godfrey (5 Rex)
J. H. H. Robinson (6 N.S.U.)
H. Childe (3½ Triumph)
P. Janson (3½-4 Bat)
*A. M. Lomax (3½ Triumph)
F. G. Smith (3½ Triumph)
W. Adam (3½ Triumph)
A. O. Holmes (5 Crypto)
G. E. Purchase (3½ Triumph)
Dr. C. Gibbons (3½ Minerva)
A. G. Fenn (3¾ Rex)
W. Pratt (3½ P. and M.)
*R. G. Mundy (3½ Triumph)

TRICARS.

M. W. Randle (10 Lagonda)
F. Cozens (10 Lagonda)
H. S. Freeman (10 Lagonda)
F. A. Hardy (6 Panhard)
Dr. E. W. Brewerton (10 Lagonda)

*Signifies competitors for the Schulte Cup and special cup for motor bicyclists.

At Grantham, a number of Nottingham motor cyclists, including Mr. E. G. Young, were waiting to give the competitors a reception. Here some 400 eggs were disposed of by the competitors. Wells, Sale, and Sproston led the vanguard into Doncaster, where Mr. W. E. Corcutt noted the times of the competitors. At Wetherby, as usual, the second breakfast was waiting for the plucky riders, and a crowd of people welcomed them. The run is creating more interest every year. Hundreds of people lined the route through the towns and villages.

No fewer than seventy motor cyclists got through to Edinburgh, and will be eligible for gold medal awards. Then there were three tricars which covered the distance in safety, and twenty-three cars which completed the journey. Thus, of the 126 who left London, ninety-six arrived in Edinburgh. The run to many of the competitors was not of the most enjoyable nature, and for that the weather was largely to blame. There was a drizzling rain for an hour or two during Friday night, and the trouble on Saturday was

Miss M. Hind (5 h.p. Rex) leaving the Newcastle control. She had quite an enthusiastic reception at Newcastle.

caused by wind and dust. It was a bitterly cold "nor-easter" that was blowing practically all the way, and it drove clouds of dust straight into the faces of the competitors, who were thereby seriously inconvenienced. Eye trouble was a common complaint, and one of the earliest arrivals said it was no unusual thing to get into such a dense cloud that he could not see twelve yards in front of him. A further complaint was that in more than one part of the journey there were very rough stones on the road, and R. C. Davies came to grief about forty miles out from London over a heap of unlit stones. Notwithstanding a spill, he persevered on to Doncaster, but his magneto was so damaged by the shock that he decided to give up the attempt to ride to Edinburgh, left his machine at Doncaster, and took train to Edinburgh.

There were, unfortunately, two more accidents, which threw R. M. Brice and E. Pond out of the run. Brice, one

The M.C.C. London to Edinburgh Run.—

of the most experienced and steadiest of riders, and who has taken part in this run on several previous occasions, collided with a boy of fourteen or so, who was on a push-bicycle, at a crossway near Wetherby, and both were reported to be badly hurt, particularly the boy. Everyone regretted that such a thing had happened, and it may be stated that this is the first thing of the sort that has happened since this run was instituted. Pond, it seems, had fallen foul of a ditch or a bridge somewhere about Grantham, and had been taken to hospital in an unconscious condition.

Miss M. Hind was the only lady motor cyclist, and she was well within time when she reached Edinburgh. This is the first time a lady on a motor bicycle has done the journey in connection with the competition. Twice before, however, Miss Hind has taken part in the run—first on a 9 h.p. Singer tricar, with a lady passenger, and last year on a car. Miss Hind had quite a pleasant journey, despite the strong head wind, and to look at her one would have thought she had come no further than Levenhall instead of all the way from London town. Except for a tyre puncture during Friday night, Miss Hind had no trouble of any sort.

The competitors were preceded by two official cars—one lent by the president of the club, Mr. Charles Jarrott, and the other by Mr. F. J. Jenkins, one of the committee. The travelling marshals in these cars were Mr. Jenkins, Mr. R. H. Head, and Mr. Arthur Candler, and their duty was to organise the run all the way down and to see that the competitors conformed to the requirements. The marshals came on half an hour in advance of the competitors, and set the watches *en route* by that of the timekeeper.

There were two cups competed for on the double journey—one the Schulte Cup, for all classes of motor vehicles costing not more than £250, and the other the Motor Cycling Club Cup, for motor bicycles only.

The arrival of the competitors at the Royal Hotel, Prince's Street, attracted a great deal of attention, and so big was the crowd gathered round the door, that the police, including a mounted man, had to control the traffic. The first arrival, W. H. Wells, came in shortly before seven o'clock, and the others came in at intervals more or less long.

Appended is a list of the survivors who reached Edinburgh:

MOTOR BICYCLES.—S. G. Frost, S. Webb, C. G. Myer, W. H. Wells, J. S. Harwood, W. H. Lane, H. G. Cove, A. G. Reynolds, W. A. Sale, G. E. Roberts, A. M. Tatham, E. Gwynne, A. de S. Hutton, A. D. Draper, V. Olsson, L. A. Baddeley, A. D. Nicholson, G. W. Raper, T. F. Cox, C. J. Seed, H. Collins, H. M. Bentley, C. H. Crole-Rees, P. H. Trotman, F. White, H. G. Bell, B. Cumberland, W. A. Jacobs, Miss Muriel Hind, H. S. Myer, Capt. Sir R. K. Arbuthnot, Bart., R.N., J. P. Le Grand, J. L. Barratt, D. S. Baddeley, I. B. Hart-Davies, G. L. Fletcher, A. J. Sproston, J. V. Robinson, A. S. Phillips, G. Gibson, A. H. Forbes, O. L. Summers, C. C. Cook, A. B. McDonald, R. O. Clark, M. Campbell, Dr. C. B. Moss-Blundell, H. P. Beasley, H. C. Sayer, A. Walton, C. F. Lacey, A. T. Browett, J. O. M. Dixon, P. C. Campariole, G. Rowden, W. H. Bishop, H. C. Haûrott, H. Cowlin, J. Winslow, P. E. Quick, S. H. Clay, O. C. Godfrey, J. H. H. Robinson, H. Childe, P. Janson, F. G. Smith, W. Adam, A. G. Fenn, William Pratt, and R. G. Mundy.

TRICARS.—F. Cozens, H. S. Freeman, and Dr. E. W. Brewerton.

THE RETURN JOURNEY.

Those who elected to go the return journey had a quiet send-off when they set out at half-past twelve on Monday morning, and Mr. Bidlake superintended their departure. Several of those who got through to Edinburgh had intended to make the double journey, but did not do so for one reason or another, and those who started for London in competition for the Schulte and the M.C.C. Cups were: S. G. Frost, A. G. Reynolds, E. Gwynne, C. H. Crole-Rees, G. L. Fletcher, A. S. Phillips, O. L. Summers, R. O. Clark, H. P. Beasley, J. O. M. Dixon, J. Winslow, and O. C. Godfrey.

The Schulte Cup and M.C.C. Special Cup. Arrival at Barnet.

Almost with the punctuality of an express train, those competing for the Schulte and Motor Cycling Club trophies arrived at Barnet on Monday night. Tired and dust-begrimed they were, but cheerful and delighted at having accomplished successfully the double journey of nearly 800 miles. Twelve motor cyclists were despatched from Edinburgh, and only two failed to reach Barnet; or in other words, eighty per cent. of the starters finished the journey. The first man to arrive was R. O. Clark (four-cylinder F.N.), who started late and arrived a trifle early. Next came S. G. Frost (4½ h.p. Minerva), A. G. Reynolds (3½ h.p. Vindec), and O. C. Godfrey (5 h.p. Rex); all three reported having made an excellent journey. The roads and weather were all that could be desired, and the wind in the favour of the competitors. The other arrivals were: J. Winslow (5 h.p. Rex), who had had tyre trouble; C. H. Crole-Rees (6 h.p. Advance), who had had trouble with his front forks; A. S. Phillips (5 h.p. Vindec); L. Gwynne (3½ h.p. Vindec); H. P. Beasley (5 h.p. Rex), tyre and belt troubles; and O. L. Summers (3½ h.p. Vindec). Gwynne, Phillips, and Summers suffered no trouble whatsoever, and expressed themselves delighted with the journey. Some of the men had most elaborate route cards carried in frames or glass-fronted boxes, which were illuminated by electric light. All the competitors agreed that, though they had a very hard ride on the outward trip, the return portion of the competition was delightful. Reynolds appears to have kept very closely to schedule time all through, but stated that to do so was a tremendous strain. At Cockburnspath he fell, fortunately without damaging his machine.

CLUB NEWS.

Nottingham and District M.C.C.

The first meet is to be held on Saturday next, the 13th inst., and the destination Newark.

Cheltenham and District M.C.C.

This club held a speed-judging competition on June 3rd. Result: 1, W. B. Gibb (1¼ h.p. Motosacoche), 2s. too fast; 2, F. W. Corbett (2½ h.p. Lamberjack), 5⅘s. too slow; 3, H. A. Cooke (5 h.p. Dreadnought), 21s. too slow.

Swindon M.C.

A speed-judging competition was held on May 16th, between Swindon and Castle Coombe; distance, twenty-six miles; time allowed, without voluntary stops, 82m. 6s. Results: W. Jackson (5 h.p. Twin Rex), 83m.; R. G. Hannington (3½ h.p. Triumph), 77½m.; H. Rayor (5 h.p. Twin Rex), 93m.; C. S. Wilson (3½ h.p. Triumph), 71¼m.; C. Webb (5 h.p. Rex de Luxe), 103m.

Birmingham M.C.C.

The result of the above club's annual reliability trial, held on Whit-Monday, was as follows: F. G. Sandison (3½ h.p. Triumph), 1st; F. H. Southam (5 h.p. Vindec), 2nd; R. W. Duke (3½ h.p. Triumph), 3rd; F. W. Aston (3 h.p. Triumph), A. H. Haden (3½ h.p. New Comet), S. C. Perryman (5 h.p. Norton), A. Shrieves (5 h.p. Rex), and E. W. Winckle (2 h.p. Clément-Garrard) also completed the course.

Welsh A.C.

The hill-climbing contest on Philadelphia Hill, Carmarthen, on the 5th inst., before a large crowd, resulted on formula as follows:

E. T. Strick (Clément-Garrard)	.76
Donald Burnie (3½ h.p. Triumph)	.67
J. Shimell Andrew (3½ h.p. Triumph)	.67
G. P. Gold (3½ h.p. Triumph)	.654
W. G. Mason (3½ h.p. Triumph)	.652
B. T. Davies (3½ h.p. Brown)	.63

Competitors were allowed three ascents of the hill, the best time to count. The fastest ascent was made by B. T. Davies in 1m. 41⅖s. The winner now holds the Cory-Yeo Cup.

M.C.U.I. (Dublin Centre.)

The first speed trials of this season were held on Portmarnock Sands on Saturday, May 30th. Results:

Two Miles Members' Handicap.—S. Findlater (J.A.P., 85 by 76), 30s., 1st; P. Hurse (Peugeot, 75 by 75), 60s., 2nd.

Twenty Miles Open Handicap.—S. Findlater (J.A.P., 85 by 76), 5½m., 1st; B. Dumphy (J.A.P.-Matchless, 85 by 76), 4½m., 2nd; C. B. Franklin (J.A.P., 85 by 85), 3½m., 3rd.

C. E. Murphy (Triumph, 84 by 86) was disqualified in both events for not riding a properly-equipped machine. S. Findlater and H. Quinn were cautioned for not keeping to the correct course.

Club News—

Cambridgeshire M.C.C.

The run on the 14th inst. is to Bedford, meeting at the Westminster College at 9.30.

On the 18th inst. meet at headquarters at 2.45 for Huntingdon *viâ* Caxton Gibbet, Papworth, and Fenstanton. Members are requested to make a special effort to attend this run so as to become acquainted with the course for the reliability trial on the 25th inst.

A Leeds M.C.C. trophy. The Kelly Cup, won by F. W. Greenwood on a 3½ h.p. Rex. Thirteen competitors out of seventeen made absolutely non-stop runs.

Perth and District M.C.C.

A reliability trial was held on the 30th ult., starting from Strathord Bridge. The route was by Stanley, Caputh Bridge, Dunkeld, and New Inn to the starting point, continuing by Perth, Almondbank, Pitcairngreen, Moneydie, New Inn, and back to Strathord. The first few in order of merit, irrespective of speed, were as under: J. Adamson, D. Y. Sommerville, J. Livingstone, C. W. Livingstone (tied), B. Syme, J. P. Crichton, E. A. Gorrie, and D. Robertson. The first prize under club rules goes to Mr. J. P. Crichton.

Bolton and District M.C.C.

A reliability run was held on the 30th ult., the course being from Bolton to Gisburn—a distance of ninety miles. The winner proved to be the secretary of the club, who rode a 2¾ h.p. Minerva. Result: 1, A. Richards (2¾ h.p. Minerva), gold medal; 2, A. R. Batten (3 h.p. Headward); 3, J. Fishwick (6 h.p. N.S.U.), consolation prize; and 4, H. Davies (3½ h.p. N.S.U.), consolation prize. There were fifteen entrants and twelve starters. A speed judgment trial has been fixed for July 18th.

Bocardo M.C.C. (Oxford).

A hill-climb (handicap) and speed-judging contest held on the 28th ult. resulted as follows: Result of hill-climb (Prof. Callendar's formula).—1, H. J. Hill (5 h.p. Vindec Special), time 34⅘s., figure of merit 58.8; 2, H. Braithwaite (2¾ h.p. De Dion), time 64s., figure of merit 65. Result of speed judging, the object being to ride machine over a measured quarter of a mile at an average rate of 15 m.p.h.—1, H. J. Hill (5 h.p. Vindec Special), time 56s.; 2, G. Arnett (2¾ h.p. Phœnix), time 55⅘s.

Motor Cycle Union of Ireland (Ulster Centre).

On Saturday, the 13th inst., at four o'clock, a hill-climb will be held at Sugar Loaf Mountain. Two classes are included. Entries close Thursday, the 11th inst.

The inter-centre competition for the Triumph Cup takes place on Saturday, June 27th, at 2.30 p.m., starting from Tolka Bridge, Drumcondra, finish at Balmoral, outside Belfast.

Competitors in the hill-climbing competition of the Bocardo M.C.C. (Oxford).

Liverpool M.C.

On Saturday next a reliability trial to Newport (Salop) and return has been arranged. The start is from Pepper's, Claremont House, near Queen's Ferry Cross Road, at 2 p.m. Entry fee (2s. 6d.) must be in the hon. secretary's hands to-morrow (Thursday). On the following day the run is to Hale; 20th, Winwick; 21st, Rufford.

North-west London M.C.C.

The committee, having received the judges' and checkers' reports, are now in a position to announce the final results of the club twelve hours' reliability trial from London to Coventry and back on May 23rd. The following have been awarded a silver cup, which will be presented at the annual dinner and prize-giving: A. S. Phillips (5 h.p. Vindec), G. Rowden (3½ h.p. Bat), E. Gwynne (3½ h.p. Vindec), Miss M. Hind (5 h.p. Rex), W. H. Pidgeon (3 h.p. Rex-Goldhurst), C. H. Burton (3½ h.p. Vindec and sidecar), S. A. Knaggs (2½ h.p. Ariel), G. H. Hollis (3½ h.p. Triumph), H. G. Cove (3½ h.p. H.G.C.), G. Bennett (3 h.p. Marlborough), M. Tuchmann (3½ h.p. Triumph), C. H. Crole-Rees (6 h.p. Advance), M. Campbell (5 h.p. Vindec), W. G. Barton (3 h.p. Triumph), T. G. Blundell (3½ h.p. Triumph), D. K. Edwards (2¾ h.p. M.M.C.), and E. W. Ashworth (7 h.p. Minerva).

In addition to competitions already announced, it has been decided to hold a flexible hill-climb on October 10th. Mr. C. G. Myers has kindly offered a cup for competition at this event. The committee have accepted the offer, and passed a vote of thanks to the donor.

Members are reminded of the speed-judging competition, which takes place on Saturday, June 13th, the entrance fee for which is 2s. 6d. Any member who has not yet received entry forms and full particulars should communicate immediately with Mr. T. G. Blundell, jun., 30, Ferncroft Avenue, Hampstead, N.W.

Cambridge University M.C.C.

Results of competition for Rolls cup. A hill-climb was held at Sharpenhoe on May 16th, and the reliability and petrol consumption test was held on May 23rd, the route being: From Cambridge to cross roads two miles from Newmarket, and thence back to Cambridge by Six Mile Bottom and Gog and Magog Hills. This circuit was traversed three times, being a total of eighty miles.

Name and machine.	Hill-climb.	Petrol consumption.	Reliability.	Total.
E. D. Dickson (5 h.p. Vindec)	260.9	57.28	300	618.18
N. W. Hutchinson (3½ h.p. Triumph)	270.7	43.07	300	613.77
J. M. Oakey (5 h.p. Vindec)	253.6	27.05	297½	578.15
C. L. Mere (3½ h.p. Triumph)	235.1	28.4	292½	556
A. R. Murray (3½ h.p. Triumph)	217.3	16.24	275½	509.04
C. H. Stephenson (6-7 h.p. Bat)	152.6	33.8	300	486.4
R. G. Heyn (5½ h.p. Rex)	130.4	38.4	300	468

The figure of merit at Sharpenhoe was multiplied by ten and subtracted from 500; 300 was the maximum of marks allowed for reliability. One mark was given for every mile per gallon better than eighty miles for single-cylinders and fifty-five miles for twin-cylinders.

S.E. Auto Cycle Association.

At the last committee meeting fifteen new members were elected, and the honorary secretary reported that applications for membership forms under the 5s. associate scheme have been so numerous that he found himself quite unprepared for the rush, and had been obliged to wait for the five hundred forms now on order from the printers.

The legal department is now under the control of Mr. J. A. T. Good, the club solicitor, who has defended successfully so many motor cases, and is an enthusiastic motor cyclist himself. Prospective members should apply to H. B. Renner, 31, Kidbrook Park Road, Blackheath, S.E.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Pedals in the T.T. Race.

[3355.]—I am pleased to notice that pedals are barred in the Tourist Trophy Race. It should be a great inducement to the private rider to compete. I look forward to the time when they will be barred in all other competitions.

E. VARNEY.

Day of the Quarterly Trials.

[3356.]—In reply to Mr. Edgar W. Brighten's grumble, I wish to say I am an average amateur with a business to attend to; consequently I am unable to leave my business on a Saturday. The last Quarterly Trial, which was altered from a Saturday to a Wednesday, is the only one I have ever attended, although I have been a motor cyclist four and a half years. Were the trials always held on any day but Saturday, I with several others would immediately join the A.C.U. and enter. Surely if Mr. Brighten gets three out of four fixed for a Saturday he ought not to grumble. I should like to see a club started for trials, hill-climbs, etc., to take place on, say, Wednesday or Thursday, or any day but Saturday.

EARLY CLOSING THURSDAY.

Behaviour of Rubber Belts in Wet Weather.

[3357.]—In a recent issue of *The Motor Cycle* "Ixion" writes about rubber belts slipping in the wet, and I write this merely to state that I think all rubber belts slip if the rubber gets at all wet. I have had two, and both were alike, so long as the rubber was on the gripping sides, and I got slip before I had ridden a quarter of a mile in anything over dampness caused by fog. When the rubber got worn off the sides they gripped all right, but slipped a lot on dry dusty roads; in fact, I found the canvas held the grit and caused a lot of wear on the pulley. I now use only a leather belt and find it wears the best. My pulley is cut to correct angle, and the belt rim is a James.

J. HAYTON.

A Suggested Formula.

[3358.]—I always read with great interest the various problems which appear in the "Questions and Replies" of *The Motor Cycle* every week, and hope the following may be of interest to some of your readers:

If M be the driver of a motor cycle, working with velocity V; if a sufficiently high value be given to V it will ultimately reach PC. In most cases V will then = O. For low values of V, PC may be neglected; but if V be large it will generally be necessary to square PC, after which it will again assume a positive value. By a well-known elementary theorem—

$$PC + LSD = (PC)^2$$

but the quadrature may be sometimes effected by substituting X^3 (= XXX) for LSD. This is preferable if LSD is small with regard to M. If LSD be made sufficiently large PC will vanish.

Now, if JP be substituted for PC (which may happen if the difference between M and PC be large) the solution of the problem is made more difficult because no value of LSD can be found to effect the quadrature of JP, for, as is well known, $(JP)^2$ is an impossible quantity. Note.—The value of V need not suffer diminution if a circle be described about PC, then the method of least squares should be used, especially when LSD is a rapidly vanishing quantity.

OLD JOE.

Gudgeon Pin End Brasses.

[3359.]—Regarding letter No. 3319, I fitted the same idea to a home-made engine as far back as 1904, only improved by fitting a small pin to project from side of gudgeon pin into a recess in piston, to arrest any possibility of gudgeon pin turning round. If "Ilfordian" cut ½in. off each end of a gudgeon pin like mine, it would barely stop in the piston. If properly fitted, $\frac{3}{16}$in. is ample, as brasses do not wear. I have found it a success on two engines of mine and also a friend's. I have never had a set-screw fall out; I did not give such an unmechanical idea the chance.

Common stationary gas-engine practice is not always good for a motor cycle engine, as a set-screw has very little chance of proper exit from the latter. Some makers are dull. I never saw the brasses idea before I fitted it, and am surprised more makers do not use it.

FRANK CHAMBERLAIN.

Soldering Petrol Tanks.

[3360.]—Referring to letter No. 3334 *re* soldering of petrol tanks, I may inform "Llewen Side" that, having had a few years' experience in the use of petrol for various purposes, I am not so much in ignorance of its nature as to solder with the filler cap on. Both the cap and the petrol tap holes were open. Also the tank was washed out about three times, and then it was left overnight before soldering. I must confess that I am yet puzzled as to how the explosion was caused. If there was any gas present, it must have been in a very small quantity, and, of course, the pressure must have been nearly nil. Anyway, the force of the explosion was sufficient to blow the sides and top of a tinned steel tank open. The result, after being extremely careful, convinced me that others less careful and experienced may easily make a very disastrous mistake. Hence my warning.

FRED WHITTAKER.

Sidecars, Belts, and other Interesting Items.

[3361.]—The issue of May 20th of your excellent journal is one of the most entertaining I have read for some time, as it discusses many interesting points, on most of which all motor cyclists have an opinion of some sort.

For instance, "Road Rider's" remarks *re* sidecars will be chosen as a text for innumerable letters from various sources—chiefly as a disguised and free advertisement from those monetarily interested. The chief disadvantages mentioned in the paragraph against the rigid sidecar can easily be removed. The sidecar I had built to my specification shows none of them, hence it can be done.

While on the subject of sidecars I may revert to Mr. Pooley's letter *re* tyres. The rigid sidecar is not hard on tyres. I must modify this statement by saying it depends firstly on what you call a tyre, secondly on the wheels being vertical, and in alignment.

When I was having my machine built over fifteen months ago I wrote to Messrs. W. and A. Bates, of Leicester, for their advice as to tyres for my particular requirements. I stated horse-power, weight, mentioned style of sidecar, etc., and I followed their advice, with the result that since fitting I have not had my covers off the rims once. It is a tip motor cyclists should all adopt. Get your pet tyre makers to state in black and white what they recommend, adopt it, and make them stick to what they said should you ever meet trouble. But you won't provided your tyres are what

they should be. If I could make the rest of my machine as reliable as my tyres I should have a no-worry combination indeed.

Referring to "Ixion's" unique rubber belt experience, I can only say that during the four years I have used Dermatine belts I have had nothing like that happen. In fact, I think the belts grip better when wet, especially if they are slightly worn, and of correct tension.

Re the belt fasteners. I had a great worry from these, because they had to stand the racket of my Osborne four-speed and jockey pulley. I overcame the difficulty by using a countersunk screw, with a nut underneath the belt. Any good hook fastener of the Celerio variety can be thus adapted. The shortening is not messy at all, and here, again, I have my own method.

Perhaps I was a bit too soon in writing my letter No. 3325. Since then I wrote to the makers stating I found no improvement in the running of my motor, but thanking them all the same for the trouble they had put themselves to. I expected that would conclude the whole matter.

Imagine my surprise when I received a few days after a letter from them informing me of despatch of a new and tested motor, which they begged me to compare with my old one, I eventually to return the one I did not choose.

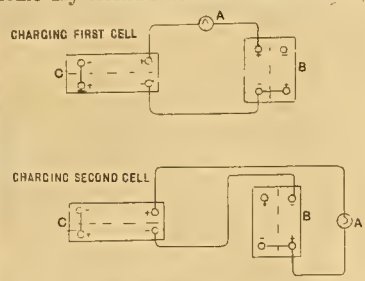
I do not think you could better this for fair treatment and an earnest desire to satisfy, and for that reason, and after what I have written, it deserves the greatest publicity.

As I have previously stated, I am in no way connected with any of the articles mentioned

B. RICHARDSON BILLINGS, M.R.C.S., L.R.C.P.

New Use for an Electric Headlight.

[3362.]—If not already known, I think the following may be of some use to those of your readers who motor cycle in pairs. Ten miles from home my friend's accumulator ran out, showing only 3.25 volts on voltmeter. My own accumulator being well up, and of 20 ampere-hour capacity, we took both accumulators from machines, and charged his from mine, one cell at a time, for half an hour each cell.



A. Electric headlight.
B. Accumulator to be charged.
C. Charging accumulator.

The connections were as shown in the sketch herewith.

This carried us home all right without a misfire.

HAROLD J. COX.

P.S.—An ordinary pocket test lamp would, of course, have served just as well as the headlight, though it would probably have necessitated longer charging, owing to its not taking so much current.

Petrol in Small Tins.

[3363.]—Perhaps an experience of mine the other day may be of interest to your readers, and cause them to be exceedingly careful (as I shall be in future) when having their tanks replenished to see they get the proper article. I had my petrol tank filled up at a small garage from a Shell can (not sealed), and had gone a few miles when my supply pipe broke. After a short stop to repair it I was unable to restart the machine, and after spending about one and a half hours, testing everything, I discovered I had been served with paraffin. A car driver very kindly stopped and gave me some "genuine Pratt's," which enabled me to ride to the next town. For the convenience of motor cyclists, why cannot manufacturers send out petrol in sealed gallon cans as well as the two gallon size? Only the same day I should have got in a supply at another place just before reaching the "paraffin garage," but they would not serve less than two gallons.

On the above run I broke my front cylinder exhaust valve (my first), but after a five minutes' stop to take out the broken valve head, I rode the remaining sixty miles home on one cylinder at a good twenty miles an hour—one point in favour of the twin!

F. H. M.

Silence.

[3364.]—In your issue of May 20th "Road Rider" advises riders not to use too good a silencer. I think this is rather bad advice, as there is no doubt that motor cycles are disliked by non-riders, chiefly on account of their noise, which, in a good many cases, is very far from silent.

In support of my opinion that you cannot have too good a silencer I may mention that on the 19th ult. I was fined at Bow Street for passing a cab shelter on the wrong side, and one of the points upon which the magistrate laid great stress was whether the machine was noisy or not. Fortunately for me I use one of Sharpe's silencers, and the exhaust is practically inaudible. Had it been otherwise there is no doubt my fine would have been considerably higher.

Some riders, of course, dispense with silencers altogether. I met five such in Piccadilly a few days ago, and I can assure you they were not creating a very favourable impression.

LC 2312.

Police Methods.

[3365.]—The letter appearing in your issue for May 27th under the heading "Police Methods," and signed "White Coat," to my mind, raises one or two important questions.

Firstly, what right have the police to demand the inspection of a license when the owner is on private property, *i.e.*, in this case, the hotel yard? Secondly, assuming the police have a right, when and where is one free from such annoyance after having garaged one's motor?

It appears to me that the necessity to comply with a demand to have one's license examined only holds good when in charge of a motor on a public highway, and that under conditions as experienced by "White Coat" should be resisted on principle.

S. G. L.

[The Act says: A licensee must at any time *whilst driving a motor car* (a motor cycle is a motor car within the meaning of the Act) produce his license to a police constable on demand.—ED.]

Unattached Riders.

[3366.]—In reply to Mr. H. G. Cove's letter *re* unattached riders in your last issue, I think every motor cyclist is agreed that the C.T.C. cannot possibly offer anything like the advantages offered by the A.C.U.

But Mr. Cove misses the vital point. What unattached riders want are the advantages he enumerates at a 5s. subscription, and not 10s. 6d. with an entrance fee of 5s. in addition, as this would make his outlay 15s. 6d. in all, which is more, I think, than the advantages are worth to him (as an unattached rider).

I am glad to see that the S.E. Auto Cycle Association is alive to this want, for according to its scheme all unattached riders from any part of the United Kingdom may become associate members for a subscription of 5s., and be thus affiliated to the A.C.U. and R.A.C. In other words, they will get all the advantages offered by the A.C.U. at 10s. 6d. for 5s. (and a few others as well). I, for one, am joining the S.E. Auto Association, and am sure that many thousands will do the same.

H. A. COOPER.

An Opinion from Japan.

[3367.]—"Does an air-cooled engine overheat?" During a recent trial in India I ran from Thana to some distance up the Bhor Ghat at full speed the whole way—about fifty-eight miles. (No speed limit in India, except in towns and villages.) I did not stop at the foot of the hill (rise of about 2,000ft. in four miles, with numerous hairpin corners) to cool, and the machine took the hill all right. I was pulled up by not being able to get round a bad corner. I lubricated very freely the whole way, but never had the exhaust smoky. The engine did not "smell" hot, and I am not a crack rider by any means. My Norton is the first motor cycle I have owned. I had a tricar previous to that, about which the less said the better. Some years ago my brother had a motor cycle (Buchet engine) which used to get red hot, but it did not seem to affect its running at all.

With regard to using a cut-out, it is not motor cyclists only who are the culprits. Two of the cars in the New York-Paris Race passed through here (Tokio) recently. One was running with an open exhaust. I should not think that it is good for the motor movement in a country where motors are a novelty.

TOKIO.

The Carnmoney Hill-climb.

[3368.]—Reading the reports and makers' glowing advertisements of the above event would give the stranger an impression that there was a hill to climb. The so-called hill is merely a bump on a side-road, the velocity of the machine down one side at the start carrying the machine up the other, with very little exertion on the part of the engine.

Surely the M.C.U.I. does not get up the sport for youngsters or novices only, together with the featherweight riders, with caps, neckties, exhaust pipes, etc., removed.

The winning machine in one event simply flew up the hillock, with the engine misfiring half the time. This machine was a home-made affair, and not to be compared with the magnificent ones present. If it had been firing properly no time could have been taken, as it would have climbed the hillock almost instantaneously. The other event was won on a machine of ancient construction, long since discarded by the makers. Surely the M.C.U.I. could try a slight incline such as the "Horseshoe," which is a regular road, and see how pumping of carburetters, elastic bands over float rods, dwarf engine pulleys, variable gears, etc., would do in an ordinary tourist run.

The cars would have been much better to have stayed at home, as they simply affronted themselves, with the exception of the winning one with the special gear box, which acquitted itself admirably.

I trust the M.C.U.I. will consider the Horseshoe, and give us an exhibition worthy of the name. WELLWISHER.

An Interesting Letter from Newfoundland.

[3369.]—I notice that there has been considerable discussion recently in your interesting journal *re* light and heavyweight machines, also belt and chain drive, and as most of your correspondents appear to be in favour of belt drive, I am moved to give my experience with chain drive, which I have been using for the past three years in conjunction with a 1¾ h.p. machine, weighing under 100 lbs. First and foremost, this is a very hilly country, and I know positively that I could not ride up half the hills to be met with on our main roads, if I were using a belt. I come to this conclusion by noting the experiences of a motor cyclist here who uses a machine of same h.p., but with belt drive.

While touring during last summer, I succeeded, strange to say, in negotiating a hill at first attempt on which three standard touring machines (3½ h.p.) of best English manufacture failed to get up. The hill in question has a hairpin turning half-way up, and a grade of about one in four on the turn and for a short distance beyond. The heavy machines could not be driven around the sharp turn at sufficient speed to keep going on the rest of the hill. In my case with a light machine I slowed down somewhat when taking the turn, and then pedalled a few revolutions, after which the machine picked up, and finished the climb in a satisfactory manner. The machine in question is geared 6 to 1.

The harsh drive which some people seem to fear is completely overcome by a patent compensating sprocket on the counter-shaft, which makes the drive as easy as with a belt. One set of chains lasted two seasons, when they became stretched, and I thought it best to discard them. The chain connecting pedals with rear wheel (for starting the machine) is of the same pitch and dimensions as the driving engine chain, and can be interchanged if necessary. The counter-shaft is on an eccentric, so that slack can be taken up.

I understand that this year's model has this improvement. The machine I have at present has been in use three seasons, and the only repair to the engine has been a new exhaust valve. The original valve pitted somewhat after being in for two years without being removed. The original sparking plug is still in service, although I carry spares in case of necessity. I am a firm believer in leaving an engine severely alone, until absolutely necessary. I can travel at the rate of thirty-five miles per hour, but the roads here will not really allow more than twenty-five miles per hour, and only for very limited stretches at that.

The heavy machine would, of course, be more suitable for a Goliath or a speed merchant, or in connection with passenger work. Strange to say, the makers of my machine list a side-car to go with the 1¾ h.p. machine, which I have no doubt would prove suitable on level roads, such as we, unfortunately, do not experience in Ye Ancient Colony.

G. H. M. B.

Belt v. Chain and Two-speed Gears.

[3370.]—Allow me to heartily endorse Dr. Patterson's letter. I am an engineer, and a user, not a builder, of motors. I, personally, refuse to ride with a single gear, say, from Manchester to London, meeting steep hills, greasy setts, tramlines, and thick traffic. Once I am hemmed in with traffic and stopped I am not prepared in the grease and traffic to go through the starting. I do not know where to get a good variable gear. I say "variable," because a three-speed gear is many times superior to a two-speed, and it will come in time. My choice at present is the belt. The chain will be infinitely superior when it has an elastic drive (not a slipping drive) and an oil bath gear case.

Last October I tried to get one of the "motor engineers of England" to build me a nice machine. I do not think it is a freak. It has a standard frame, standard 3½ h.p. twin engine and a two-speed geared back hub. It is a failure for these three reasons: (1) The handle starting will not cause the engine to start with a magneto; (2), the hub has been twice to its makers before doing 200 miles and not at their expense either; and (3) the "motor engineer," etc., made a small mistake in the weight of the machine, which is 60 lbs. heavier than he said. Of this class are too many of the motor engineers of England. They fit variable gears on the engine-shaft, reducing the speed of the unfortunate belt. They fit variable pulleys which give the smallest engine pulley when the strain on the belt is greatest. They make back hub gears of horrible weight that do not hold oil, and that have large diameter ball races. Often they are not educated as engineers. They are often not even educated men at all, and their reasoning faculties, which will bring a doctor or a lawyer to the solution of a simple problem, are not developed.

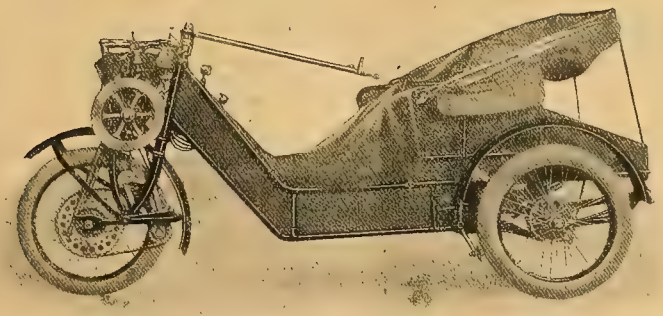
Arthur M. Startin (5 h.p. Riley tricar) in the Coventry M.C. run to Holyhead on May 30th. Leaving Menai.

For my part, I should like pedals for starting purposes; this is much less trouble than any other way, but one wants footrests also. I think the Phelon and Moore gear would be nice if it had an elastic drive and oiltight gear case, but with chains——. No; give me a belt. A chain is a nasty dirty thing to have anything to do with. You do not want even to see it, let alone have it break. Make it amply strong, and give it an elastic drive, swill it in oil, cover it up, and let it do its dirty, useful work out of sight and hearing. Then it will not trouble you with wearing or breaking. But it should be remembered that finer workmanship and material are required throughout in a motor bicycle than in almost any other piece of machinery owing to the necessity for reasonable lightness, the vibration, and the dust and mud.

A.M.I.M.E., A.M.I.C.E.

(Several letters are unavoidably held over.)

The Phenomobile



solves the problem of the Sociable Tricar.

The Phenomobile combines the simplicity and low cost of upkeep of a Motor Cycle with the comfort and efficiency of a Car. In one vital point it even excels any motor-propelled vehicle: It is **entirely free from sideslip.** There are many other advantages which the Phenomobile possesses over the ordinary type of Tricar, and we shall be pleased to furnish you with full particulars on receipt of a postcard. Prices from **105 guineas.**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Genuine Twin Rex, £22, guaranteed, spring forks, low built, goes like a flash; £16 given for 1906 Rex, £13 for 1905 Rex, £11 10s. for 1904 Rex, or £10 10s. for 1903 Rex, in part payment.—Address below.

HALIFAX.—1908 Rex Featherweight, Duplex frame, magneto, splendid climber, new; 25 guineas; exchanges.

HALIFAX. — 1908 3½ h.p. Magneto Tourist Rex, new; why pay fancy prices? 35 guineas; exchanges.

HALIFAX.—1908 Triumph, magneto, all the latest improvements; delivery now; £48; exchanges.

HALIFAX.—1908 3½ h.p. N.S.U., 26in. wheels, long bars, low saddle; £36; liberal exchanges.

HALIFAX.—Twin-cylinder magneto Vindec Special, condition exceptional; cheap, £35; spring forks.

HALIFAX.—2¾ h.p. Phelon and Moore, two-speeds, 26 wheels, carry heavyweight; £27 10s.; any trial.

HALIFAX. — 45s. deposit and six monthly payments of 29s. 6d. secures 2¾ h.p. Excelsior, 3 h.p. Humber, 2¾ h.p. Minerva, 2¾ h.p. De Dion, 2¾ h.p. Hobart, 3 h.p. Lloyds, 2¾ h.p. Minerva, 3½ h.p. Rex, 2½ h.p. Aurora, 2¾ h.p. Kerry, 3 h.p. M.M.C.; all guaranteed running order.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

? DID YOU WEARY

of your old machine at Whitsun? Did you envy the riders of the 1908 **TRIUMPHS, BATS, REXES, VINDECS,** and others? Did you yearn to get right up-to-date with a **Two-speed Gear** and **Clutch**—a machine with a starting handle **like a car?** We can provide any of those good things, making a liberal allowance for your old machine, and giving **prompt delivery** of any first-class make, including the best of all—

The WARWICK (Car Style) MOTOR CYCLE.

4 h.p. ball bearing engine, magneto, live axle two-speed gear and clutch, spring forks;

Price 45 Guineas.

Let us send you our interesting pamphlet on "The Evolution of the Motor Cycle," with description of this machine.

The following SOILED and SECOND-HAND MACHINES are in perfect running order, ready for the road, and have the **Premier Certificate** of **Fitness:**

N.S.U., new, 1908, Roc clutch, two-speed gear; cost £70	£55 0
N.S.U., 3½ h.p., 1908, with Sidecar	40 0
REX, 1908, 3½ h.p. de Luxe, 2-speed gear, magneto, accessories	40 0
ROC, 1908 Military Model, clutch and 2-speed, spring forks	40 0
ROC, 5 h.p., magneto, Roc clutch	32 0
TRIUMPH, 1907, 3½ h.p., magneto	35 0
N.S.U. Twin, 6 h.p., magneto, 2-speed gear, splendid machine	35 0
REX, 3½ h.p., coiled only, magneto, Tou ist	33 0
REX DE LUXE, Roc clutch, soiled only	32 0
REX 1907 Lightweight, not used	22 0
VINDEC SPECIAL, 3½ h.p., magneto, Truffault forks, adjustable pulley	30 0
TRIUMPH, 3 h.p. magneto	30 0
VINDEC SPECIAL, 1906, 5 h.p., Truffault	27 0
REX DE LUXE, Roc clutch and gear, perfect order	26 0
ZENITH BICAR, 4 h.p., Whittle belt, free engine	22 0
MINERVA Twin, 4½ h.p., spring fork, absolutely perfect	22 0
TWIN REX, 5 h.p., cantilever seat, grand condition	19 10
N.S.U., 3½ h.p., magneto, fine condition	19 0
ROC, magneto, Roc clutch, spring fork, good condition	19 10
EXCELSIOR, 2¾ h.p.	7 10
KERRY, 4½ h.p., Twin, 2-speed	19 0
QUADRANT, 3 h.p.	9 10
MINERVA, 2 h.p., spring forks, Brooks saddle, tyres like new	9 10
WHITLEY, 3½ h.p.	10 0
JAP, 2½ h.p.	6 0
MINERVA, 1½ h.p., spring fork, good condition	5 10
BROWN 2 h.p., good going order	5 0
CHAMPION, 3 h.p., Trembler coil	6 0
REX TRICAR, faultless, running splendidly	23 0
STEVENS TRICAR, two speeds, free engine, wheel steering	33 0
RILEY 5 h.p. 1907 TRICAR, two speeds, spring frame, wheel steering, coach built, three brakes, run 250 miles, cost £90, grand bargain	55 0

EPR

Accumulators

should be specified when ordering your new 1908 mount.

They contain all the latest improvements in storage battery construction. Our new list will tell you why "E.P.R." cells are now so generally used. It will also save your money. A post card will bring you a copy by next post.

¶ What about your present accumulator? Why discard it and throw away money? Better send it up to us, and we will make it as good as new for about half of the cost of a new cell. We could send you letters received from clients all over the country, expressing absolute confidence and great satisfaction with the way we have dealt with their repairs.

¶ AGAIN. What about your present accumulator? Not worth repairing? Well, again we say, don't discard it. We take old cells in part payment for new "E.P.R." guaranteed accumulators. ONLY, please note this, our prices are fixed as low as can be consistent with good material and first-class workmanship. WE DO NOT CHARGE YOU A HIGH price for a new accumulator, and then allow you an inflated price for your old cell. Our prices are low, and the allowances we make for old cells are actual market value.

¶ We have specialised in accumulators since 1902, so you get the benefit of our experience.

P.S. DON'T forget to post that card to night.

Richford and Co.
(Dept. M4),
ACCUMULATOR SPECIALISTS,
153, FLEET STREET, E.C.,
And at 52a, HIGH HOLBORN, W.C.
Established 1876.

STAND-CARRIERS Combined, 4s. 9d. and 5s. 9d.; large toolbags, 3s. 6d.; L.A.C. spring forks, 15s. pair; 5 h.p. Aster water-cooled engine, £9; Clarendon engines, new, 2½ h.p., £3 each; Clarendon frames, £2 each; Jane's handle-bar switches, 1s. 9d.; Mabon two-speed gear, belt drive, £3 15s.; Antoine engine, 37s. 6d.; and various other miscellaneous goods.—Wauchope's, 9, Shoe Lane, E.C.

CASH Bargains.—Motor Cycle Covers, wired edge, 26 by 2, 2¼, and 2½, 11s. 6d. each; 28 by 2, 2¼, and 2½, 12s. 6d. each; beaded edge, 2s. extra; motor cycle tubes, with valves, 26 by 2, 2¼, 2½, and 28 by 2, 6s. 9d. each; Kerry tricar lamps, brass or plated, 12s. 6d. pair; plated ratchet control levers, 1s. 6d.; Whitley carburetters up to 4½ h.p., 13s. 6d.; large plated double-twist horns, 6s.; rubber goggles, 2s. 6d.; good quality V belting, ⅝in., ¾in., and ⅞in., at 8d., 10d., and 1s. per foot; subject to being unsold; cash with order; approval.—Bastone, 217, Pentonville Road, King's Cross, London, N.

TRADE ADVERTISEMENTS.

N.S.U. Motors (West London District Agency), latest pattern models in stock, two-speed gears, spare parts; liberal allowance for your motor in part exchange; deferred payments; trial runs by appointment.—Eagles and Co., High Street, Acton. Telephone, 556, Chiswick.

TOO LATE FOR CLASSIFICATION.

ACCRINGTON.—1908 3½ h.p. Brown, accumulator ignition, new; list £37 10s., sell £32 10s.—Below.

ACCRINGTON.—1908 3½ h.p. Minerva, shop-soiled; must clear.—Below.

ACCRINGTON.—1907 Rex Model de Luxe twin tyres, Roc free engine clutch, in splendid condition; £27 10s.—Athletic Supply.

ACCRINGTON.—2 h.p. Brown, engine, rims, frame, and several other parts ready to finish; £4 10s., bargain.—Below.

ACCRINGTON.—3½ h.p. motor cycle, new tyres, in good working order, wants slight repairs; bargain for starter; £7, real. —Below.

ACCRINGTON.—2½ h.p. Royal Riley, in splendid working order; £12 10s. — Below.

3⅜ h.p. Rex, in splendid running order; £12 10s.—Below.

1908 Rex, Minerva, Brown, and Rocs, shop-soiled, to be cleared.—Particulars, Athletic Supply, Garage, Accrington.

WANTED, motor cycle, 3½ h.p.; £5 down and 40s. monthly for good machine. —Rosedene, Belsnams, Apsley, Herts.

TOO LATE FOR CLASSIFICATION.

FOR Sale, 3½ h.p. Humber tricar, two speeds, perfect condition; £22. — 5, Armitage Road, Milnsbridge, Huddersfield.

FOR Sale, 6-8 h.p. Starling, two-seater, three speeds and reverse, scarcely used; trial; £65; good motor cycle part.—W. Milburne, East View, Dalton-on-Tees, Croft.

FOR Sale, 1908 6 h.p. twin Jap, magneto, Matchless built, Dunlops, Chater-Lea sidecar, not ridden 200 miles; £40.—Hodgson, 77, Mitcham Road, Tooting.

FOR Sale, 2¾ h.p. Kerry de Luxe, low, perfect condition, new Continental, two lamps, stand, Grack, speed indicator, spares; £12 10s.—147, High Road, Wood Green, London.

WANTED, Brown and Barlow carburetter, to suit 2½ h.p., must be in good condition; cheap. — Long, Malahide, Co. Dublin.

BELT Dressing!!!—No more slipping belts. A trial will convince, 1s. 6d. per tin, post free, sufficient for 20 belts.—Ellis, engineer, Parkinson Lane, Halifax.

FOR Sale, 3½ h.p. Westfield, Chater-Lea throughout, very low, Nilmelior coil, two Pfluger accumulators, two belts; want repairing; £7 10s. — H. McK. Arkinstall, Newport, Salop.

FOR Sale, 5 h.p. Peugeot crank case, complete, timing side has been repaired; 25s.; also 4in. pulley, 3s.—Oreston, Sidcup.

FOR Sale, £5, 2 h.p. Werner, good running order, minus front tyre.—114, Risley Avenue, Lordship Lane, Tottenham, N.

WANTED, good motor cycle and cash, for good 6 h.p. water-cooled twin-cylinder Fafnir tricar, open frame, wheel steering.—Full particulars, apply, Taylor, Wharf, Chertsey.

FOR Sale, Rex pattern Triette, 5 h.p., twin, splendid goer, first-class condition; no reasonable offer refused. — 154, Southwark Park Road, S.E.

FOR Sale, Tricar, Humber, 3½ h.p., tyres, engine, all good; £20, or exchange powerful bicycle.—110, Page's Walk, S.E.

FOR Sale, 3½ h.p. Brown, spring forks, magneto, nearly new; £33.—Steer, Sidney Lodge, Beckenham, Kent.

FOR Sale, 4 h.p. Antoine, Chater No. 6, new, Moseley tyres, £17; wanted, lady-back tandem. — Meadowcroft, Canterbury Road, Leyton.

FOR Sale, 2¾ h.p. Minerva, vertical, M.O.V., late 1907, perfect condition throughout, fully guaranteed; £15.—Davison, 26, Darnley Street, Gravesend.

FOR Sale, 2 h.p. Zedel, light, Chater-Lea, low, guaranteed throughout; £9. — 26, Darnley Street, Gravesend.

BIRMINGHAM.—Repairs and overhauling, accumulators charged and repaired; prompt attention; moderate charges.—Priest and Williams, 66, Bishop Street.

FOR Sale, Triumph, 3½ h.p., 1907, nearly new condition; sacrifice, with spares, £31 10s.—45, Parade, Leamington.

FOR Sale, 2½ h.p. Fafnir, Dunlops, Longuemare, two accumulators, horn, stand, and accessories, splendid going order; price 10 guineas; seen any time.—Stored at Townend's (late Prentice), Cycle Maker, Southend Road, Eltham, S.E.

FOR Sale, Minerva, 2¾ h.p., guaranteed perfect condition, with accessories; £14 10s.—3, Meteor Road, Westcliff, Essex.

FOR Sale, 4 h.p. Military Model Roc, handle starting, magneto, new condition; £23 10s.; any trial.—Marsh House, Leominster.

FOR Sale, 2¾ h.p. Minerva Cycle, magneto, ridden five miles; exchange lightweight, or £28.—61, Church Street, Leigh.

FOR Sale, 3½ h.p. Peugeot, new, Chater-Lea, Palmer cords, bargain, £30, or near offer; also Chater-Lea sidecar, as new, Palmer cord, £7 10s.—129, High Street, Croydon.

FOR Sale, 12-16 h.p. Provincial, seats five, thorough going order, headlights, spares, etc.—18, Hailsham Avenue, Streatham.

RELIABLE Repairs.—Complete pistons from 6s.; re-boring, new piston, from 13s. 6d. —Gas Engine and Motor Works, Forest Hill, S.E.

TOO LATE FOR CLASSIFICATION.

FOR Sale, 3 h.p. Motor (Linnon) Cycle, fas £12.—Dewhurst, 52, North End Road, Kensington.

FOR Sale (£12), Humber, 3 h.p., splend condition, very little used. — 123, Se view Road, Liscard, Cheshire.

FOR Sale, Front Wheel, 26 by 2½, Palm rim, good condition, 6s. 6d.; Rot trembler coil, practically new, 10s.—Dimm 195, Gloucester Road, Bristol.

FOR Sale, 9 h.p. Riley, 1907, perfect con tion, recently thoroughly overhaul tyres in good order; owner buying car; £ including accessories.—Johnson, 151, Lond Road, Reading.

BARKER'S Iron Cement, the only satisfa tory filling for cracks in cylinde water jackets, etc.; permanent repai 1s. tin saves pounds.—Barker, Oxford Ro Worthing.

FOR Sale, 3 h.p. Olympic Motor Cycle, most new; £18, or good push cy taken in part payment.—Baker, Halw Beaworthy.

FOR Sale, 3 h.p. M.M.C. engine, comple exhaust pipe, silencer, good conditio £2 17s. 6d.—Hunt, Ystrad Mynach, Glam.

FOR Sale, or exchange for two good ac mulators and two 2½ inner tubes, borne four-speed pulley, complete. — Wa Carpenters' Arms, Sunninghill.

FOR Sale, 9 h.p. Rex Chassis, three spe and reverse, tyres, mudguards, et sell £27, or motor cycle part exchange Whittle, Latchford, Warrington.

WANTED, Light Up-to-date Motor Bi spray, good condition, under 90 lb £3 down, and £1 per month; photo; app val.—62, *The Motor Cycle* Offices, Coventry.

FOR Sale, Tandem for lady or gent; change for good pedal gent's cycle, sell £4 10s.; 2 h.p. genuine De Dion engi £2 10s.—Fidgeon, The Square, Fazeley, Sta

FOR Sale, Montgomery Sidecar, excell condition, cane body, upholste green, flexible joints; £5 10s.—Moore, Curzon Street, Long Eaton.

FOR Sale, 3½ h.p. Triumph, magneto, 1 pattern, new April 30th, this year, 1 carburetter and 1908 Clinchers; offers Moore, 27, Curzon Street, Long Eaton.

FOR Sale, Ariel Coupling, never been us owner no use for it; will take 35s.— Beech, Chequers, Lamberhurst.

FOR Sale, 3½ h.p. Triumph, fitted with f engine pulley, spares and Lucas's lar price £38; this machine was delivered bra new from makers last month, only ridc 50 miles, too powerful for owner; wo consider exchange for 1908 lightweight a cash.—W.G.S., 627, Barking Road, Plaist E.

FOR Sale, 4 h.p. magneto twin N.S.U., fit with N.S.U. two-speed gear and f engine, purchased by advertiser new 1 September, together with sidecar, 24 by Peter-Union re-enforced tyres on all whe full set tools, oilcans, two leather toolba acetylene lamp and generator, horn, pur footrests, cyclometer, long handle-bars, e etc., spares include complete inlet val complete exhaust valve, spare plain pull spare geared pulley complete, exhaust a inlet springs, magneto parts, etc., in gu anteed condition; trial run by appointm only; will accept £40.—64, Ranelagh Ro Ealing, W.

WANTED, good second-hand genuine C tinental heavy motor cycle tyre, by 2½.—Address, Cyclist, 45, Swindon Ro Swindon.

FOR Sale, 5½ h.p. Phanomen, 1907, N two-speed gear, spring forks, fan, m neto, Autoclipse lamp, Brooks non-skid back; £35.—63, *The Motor Cycle* Offices, C entry.

FOR Sale, Phœnix Quadcar, four-cylind 12-16 h.p. Fafnir motor, two speeds a reverse, Continental car tyres, non-s drivers; marvellous hill-climber; too fast owner; cost £170 April, 1907, price £95; rea for road; any trial.—395, Moseley Road, B mingham.

FOR Sale, 3½ h.p. N.S.U., little used, t accumulators, new back Peter-Uni cover, unused Riches tube, Acetyph lamp; owner no time for using; £17.— Cazenove Road, Stoke Newington, N.

Police Traps.

THE recent holidays saw the roads throughout the kingdom teeming with motor vehicles of all descriptions, with the result that the police in many districts, particularly in North Wales, were to be seen at all important road junctions noting the numbers of passing vehicles. In the course of a short tour through North Wales this became so impressed upon our mind that we began to wonder why it was necessary for every motorist, irrespective of the speed he was driving at or the consideration he was showing for other road users, to be stopped by these officious persons for his license to be examined. Is this the sort of treatment motorists may expect when visiting North Wales this year, or is it only a passing whim? It does not appear as though English visitors to the Welsh seaside watering places and inland towns particularly object to motor traffic, but it seems to be the inhabitants of the country who incite the police to adopt these most annoying practices. We have always strongly deprecated inconsiderate driving or excessive speeding, and although there are still a few offenders we cannot see why the cautious driver should be looked upon as a sort of ticket-of-leave person, whose license must be examined at any opportunity which presents itself. Presuming that the police of every village and town throughout the kingdom were to commence this system of license examination, motoring would be absolutely prohibited, and all except the most enthusiastic would relinquish the pastime. In one or two cases we made enquiries with regard to the police methods, and we ascertained that it was not usual for the police to institute measures of this nature, but Bank Holidays are specially selected for the purpose of annoying and pestering motorists, who in many cases find such relaxations from business the only time that they can tour at a distance from home. Consequently the roads are more congested than at other times.

Cases of inconsideration for others were brought to our notice in one or two districts, and it seems very regrettable that these cases cannot be brought more prominently before the various motor associations. Unfortunately, in many instances reckless drivers (they are very much in the minority) are successful in hiding their identity either behind a cloud of dust or by other means which it is unnecessary to explain. These men rouse the ire of the numerous horse owners and breeders, and in one instance we know a police trap was systematically laid at the instigation of horse owners whose cattle had been frightened by motor cars or motor cycles, and, in the case of young horses, they are not again fit for the road for a week. Young horses must be trained, and motorists should act in a proper manner and slow down when approaching restive horses. The police themselves in the majority of cases are not anxious to set traps, but there are exceptions, where police traps are merely money-making affairs, which can only be described as day-light robberies.

Why they are Laid.

THE reason the police set traps and time drivers over stretches of country is because they have received complaints from local residents who do not look upon motors with favour, and are possibly interested in something else which is antagonistic to motoring; in consequence the police are forced to do something to pacify the complainants. A good deal is heard anent the noise of motor bicycles,

but from what we can gather the chief complaint against motor traffic of all kinds is the excessive dust, and motor bicycles do not raise anything like so much dust as cars, however carefully they may be driven or however well they may be constructed to prevent dust raising. The noise of motor bicycles is more or less a bogey. They frighten spirited horses occasionally it is true, but if they are provided with a good silencer the noise of a single cylinder motor bicycle is little or no greater than a single cylinder car with an engine of larger dimensions. Dust, dust, dust is the complaint on every hand, and until something is done to prevent it and inconsiderate drivers refrain from "showing off," police traps will be laid and motorists will be summoned. One association (the Automobile Association) has decided to deal severely with all cases of inconsiderate driving, and our advice is to report such cases to the secretary, giving the number of the motor cycle or car and all particulars. Combined action alone will prevent reckless driving. As soon as drivers and owners who are inclined to use the roads without consideration for others realise that their actions are likely to lead them into trouble and exposure, they will in all probability moderate their methods. No Britisher likes *espionage*, but apparently there is no other way to deal with these gentry who pass others at full speed on the road without sounding a horn, turn sharp corners rapidly, cut in when there is only barely room to pass, refuse to stop when called upon, and generally make a pleasant pastime into purgatory for others. The considerate ones pay for the careless, and all are compelled (unless they are indifferent as to cost) to crawl along at all times irrespective of traffic, in the fear of being trapped and made to pay excessive fines, which come particularly hard on motor cyclists who can ill afford to pay them.

The first tricar arriving at Wetherby in the London-Edinburgh 24 Hours Run. Dr. Brewerton's 10-12 h.p. Lagonda.

FOREIGN TOURING.

ONE of the chief advantages to be obtained from membership of the Auto Cycle Union is that the members have free access to the Royal Automobile Club's Touring Department, which is quite the best organised in the United Kingdom. It is in charge of a capable and courteous official, who possesses a fund of information difficult to find in any one individual. Now that motor cyclists are touring in France and other European countries in larger numbers than usual, they will do well to apply for particulars of membership to Mr. F. Straight, secretary of the Union, 18, Down Street, Piccadilly, W. The Royal Automobile Club's Touring Department will arrange for a motor bicycle to be passed through the customs of most countries free of duty, will allow the tourist to take his tickets in the Club, and generally facilitates his passage. Moreover, valuable information can be obtained as regards roads, and maps of every country are sold at moderate prices. The latest list of Royal Automobile Club publications contains a list of road maps and road books relating to Austria, the Balkans, Denmark, Holland, Italy, Spain, Switzerland, and many lesser known European countries.

CHANGE-SPEED PEDALLING GEARS ON LIGHTWEIGHTS

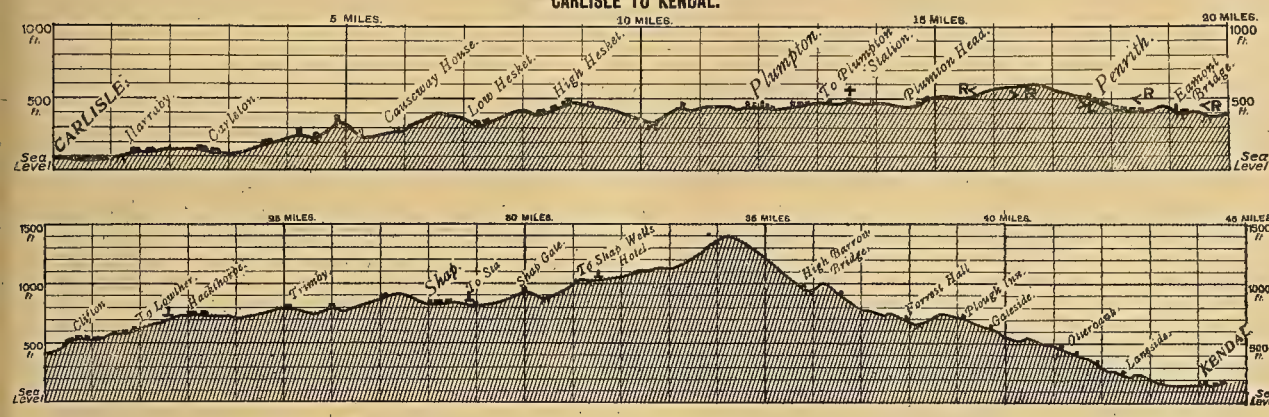
DR. HERBERT R. MAYO, a prominent member of the Great Yarmouth and District M.C.C., who will compete in the End-to-end run, informs us that he has been experimenting with a Moto-Rêve twin-cylinder motor bicycle and three-speed pedalling gear. As very little is known with regard to the behaviour of change speed pedalling gears on motor bicycles, our readers will probably be interested to hear Dr. Mayo's views. The machine is fitted with a Sturmey-Archer tri-coaster hub, but the makers were not confident that it would be satisfactory when in use on a motor cycle. Dr. Mayo says that so far it has stood the work of perpetual free-wheeling quite well, but seems to require flushing out and relubricating at shorter intervals than on pedal cycles, which is only natural, owing to the increased speed. Some of the free-wheels on motor bicycles are very far from satisfactory, as our readers have doubtless found out for themselves. Constant lubrication and flushing is required to keep the free-wheel in proper working order, exposed as it is to dust and mud. Some years ago the Ariel Cycle Co. brought out a very efficient free-wheel cover, and we wonder that more makers have not adopted a similar device. Complete protection is quite necessary.

The A.C.U. End-to-end Trial.

CONTOUR SECTIONS OF THE MOST DIFFICULT PORTIONS OF THE ROUTE.

(*Continued from page 454*).

CARLISLE TO KENDAL.



From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

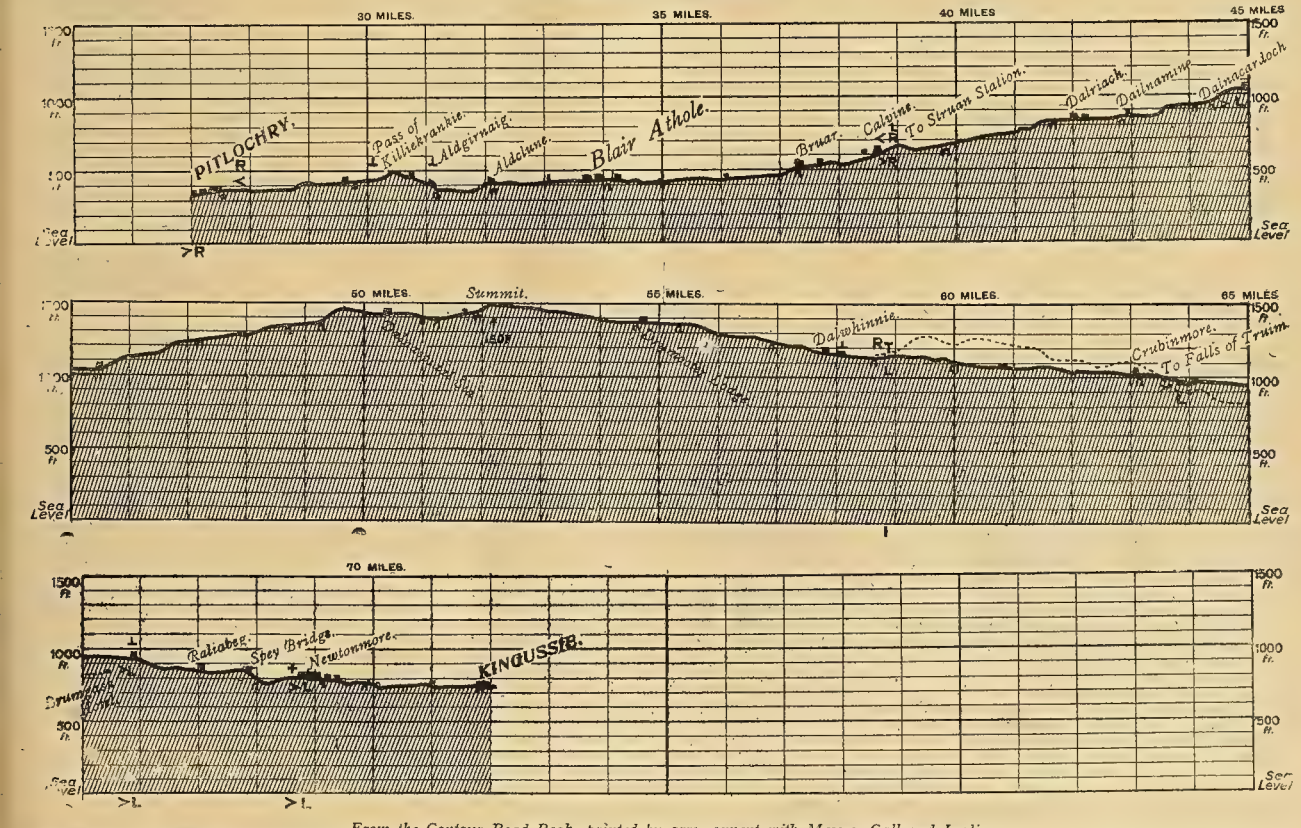
GRADIENTS.—At 4½m., 5½m., and 6m. in 16; 7½m. and 8½m. 1 in 25; 10½m 1 in 23; 20½m. 1 in 19; 31m. 1 in 22; 34m. 1 in 17; 35m. 1 in 17-13-11 (dangerous); 36¾m 1 in 17.

(For Kendal to Carlisle see previous issue.) After the border town the road skirts the coast near Gretna, and is of an almost perfect surface all the way to Lanark. There is one hill at Ecclefechan, 1 in 25, and nothing after that until Beattock, where the road goes over Beattock summit, after rising gradually for ten miles to an altitude of about 1,100 feet. Lanark, 550¾ miles.

It is a little intricate after Lanark and on the way to Stirling. The road is, however, good, except where it passes through the colliery districts, and there is one bad hill at Cumbernauld. Stirling, 586½ miles.

From Stirling to Perth the surface is good except from Stirling to Bridge of Allan, where it is rough with heavy traffic. There is a descent from Auchterarder, and a climb up to Upper Cairnie. Perth, 621¼ miles.

PITLOCHRY TO KINGUSSIE.



From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

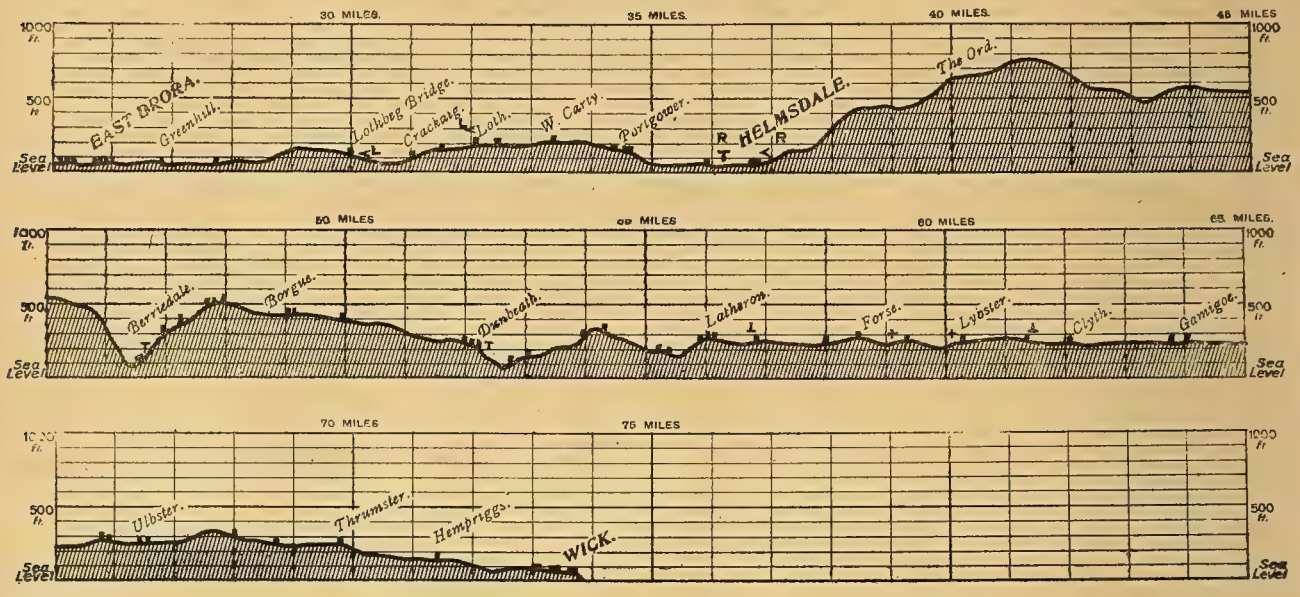
GRADIENTS.—At 30m. 1 in 18-15; 30½m. 1 in 20; 31m. 1 in 20; 31m. 1 in 19-14. With the above exceptions the gradients seldom exceed 1 in 27, but the summit is 1,300 feet above the sea

The A.C.U. End-to-end Trial—

Soon after leaving Perth the grind over the Grampians from Pitlochry to Kingussie commences. From all accounts this is a very bad road, especially in Inverness-shire, where the road is carelessly kept. Parts, viz., from Perth to Dunkeld, are good but bumpy.

After leaving Struan the surface improves on the Perthshire side of the summit, but, taking it all round, this is one of the most difficult stretches, particularly if wind or wet is encountered. The summit is 1,500 feet above sea level. Kingussie, 693 miles. *(This contour should be read from left to right.)*

EAST BRORA TO WICK.



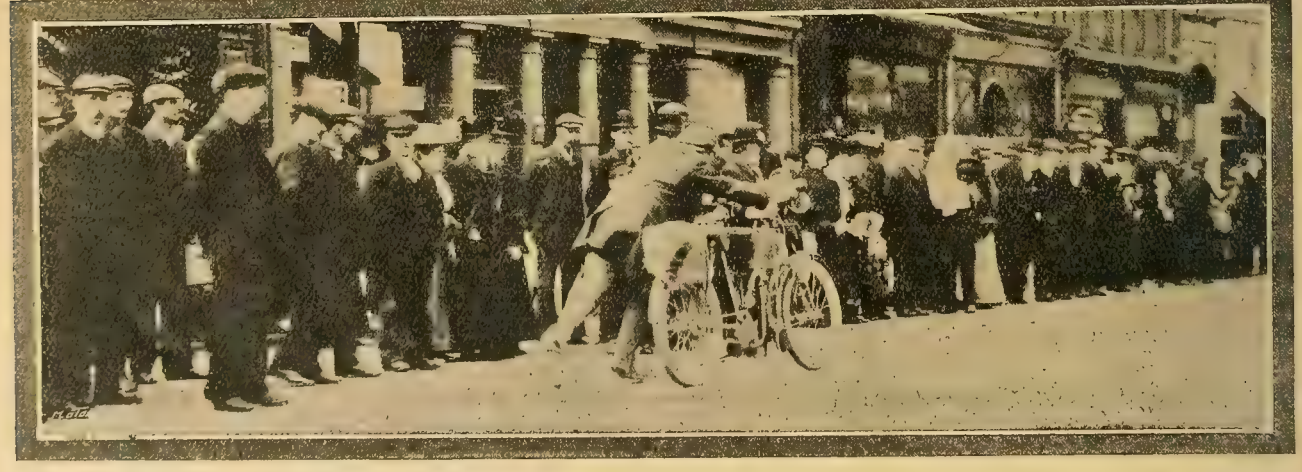
From the Contour Road Book, printed by arrangement with Messrs. Gall and Inglis.

GRADIENTS.—At 28¾m. I in 18-23; 30¾m. I in 29; 34¾m. I in 21. From Helmsdale to Latheron over "The Ord" is most trying, the steeper parts being I in 15. At 46m. Berriedale I in 9 down and I in 12 up; at 52m. Dunbeath I in 14 down and I in 17 up.

After leaving Kingussie, Inverness is the goal. There is a bad stretch from Carrbridge to Freeburn Inn, and one or two hills between Moy and Inverness; as, however, the road is approaching the coast line, it is mostly downhill. Inverness, 736¼ miles.

There are several ferries round about Inverness, the one at Kessock being chiefly patronised by record breakers. If this is taken, the distance to Dingwall is shortened by seven and a half miles; but the Auto Cycle Union Trials' riders will go round to Dingwall as in 1906. 757¼ miles.

All the way from Inverness to John-o'-Groat's the road is close to the sea, and is practically level up to Tain. Between the latter place and Clashmore there are one or two hills, but nothing exceeding 1 in 20. Between Tain and Dornoch there is another ferry, but the competitors go round by road. This runs to Bonar Bridge, and should be followed through Golspie and Brora to Helmsdale, where there is a bad hill up on to the Ord. A good idea of this and Berriedale can be obtained by consulting the contour above. John-o'-Groat's, 893 miles.



A competitor leaving Newcastle-on-Tyne in the M.C.C. London to Edinburgh 24 Hours' Run. No fewer than seventy-five motor cyclists completed the 400 miles run to schedule time.

OCCASIONAL COMMENTS

By "IXION."

Tricar Improvements.

Mr. E. W. Walford is quite right in supposing that the tap on the additional pipe of the secondary jet fitted to a 9 h.p. Riley is fixed in one position after experiment. He is also right about the simplicity of the idea as contrasted with the single drilled throttle. With a single jet, and a throttle drilled to pass the minimum amount of gas to keep the engine going, the extra air inlet has naturally to be shut as swiftly as possible when the main throttle is suddenly shut down to the minimum. The sole merit of the drilled throttle is that it is very inexpensive to fit, and not at all complicated; but it needs greater driving skill, and does not allow the engine to be run so slowly.

My Ideal Carburetter.

My suggestions for an ideal carburetter have provoked quite a host of letters, and I think I shall soon be able to describe a carburetter which fits my requirements almost exactly. The suggestions afford an illustration of the value of riders co-operating with makers, for one manufacturer writes me that two or three of the points I laid down as essential had quite escaped his notice, and will in future be incorporated in his design. Needless to say, they are little items of riding convenience, and had nothing to do with the theory of carburation. Manufacturers of complete motor bicycles invariably employ a good tester nowadays, but manufacturers of accessories are usually content with bench experiments. So it happens that there is a carburetter on the market from which one cannot detach the feed pipe without disturbing the petrol level; another which cannot be tickled without use of tools; several more the jets of which cannot be detached without the use of a very special tool not to be found in many big workshops; and so forth. I think one of the most practical points in my list was No. 9—the construction of unions in such a manner that the nuts can be easily and accurately engaged on their threads without crossing. I once watched one of our most noted riders wasting twenty minutes in a competition attempting to re-attach his feed pipe. It had a very small inaccessible nut, upside down, and as he could not get a good hold of it, nor see what he was doing, he had slightly burred the start of the thread, and so lost a prize. The best makers smooth off the first thread or so of all inaccessible screw engagements, so that the nut or union can first be accurately centred, after which engagement of the threads is automatic, and crossing is impossible. This is especially important with carburetter unions, as the metal is often soft, and a misfit is fatal, as leaks are bound to result. Given the removal of the first threads at the end of the two nuts, such troubles are impossible, provided the rider screws up the nut at each end a turn or so at a time, instead of first screwing one end right home and then trying to engage the other.

Knocking.

We have had a good many letters about engine knocks lately, which inspire me to write down my own experiences of it in a classified form.

I. Temporary; due to—
   - *a*. Caked deposit on piston and cylinder.
   - *b*. Over advance of ignition.
   - *c*. Bad lubricant.
   - *d*. Insufficient supply of good lubricant.
   - *e*. Pre-ignition of any sort.

II. Permanent; due to—
   - *a*. Loose bearings, mainshaft, big end of connecting rod, or gudgeon pin.
   - *b*. Wear of cylinder, common in machines that have been badly driven, or that have at one period of their existence been driven for a long run on bad oil, or with too little oil.

Naval officers at top of Hyden Wood Hill near East Meon, after last week's hill-climbing competition, referred to on page 485.

   - *c*. Too high a gear.
   - *d*. Wear of cylinder due to old age and long distance travelled.

I have never suffered from engine knocking, to my knowledge, from any other cause than the above, and the permanent knocking complained of by some riders is almost invariably due to their having maltreated the engine. It may have been in their earliest rides with it, and the maltreatment may only have extended over a single run. But nowadays when cylinders are so beautifully and lightly cast in the majority of instances, engines will not submit to the illtreatment which the thicker, older pattern cylinders could stand. A few hundred miles of mismanagement of the spark advance, even a single century of careless lubrication, will set up a knock in some machines of to-day that only new bushes or a new cylinder can cure. The practically permanent advance of magneto ignition or small range of retard doubtless affects the wear of connecting rod bearings to some extent, when compared with the greater range of battery ignition. Permanent knocking is more apparent on magneto ignited machines.

TABLE GIVING CUBICAL CAPACITY OF ALL SINGLE-CYLINDER ENGINES

having bores of from 50 to 90 mm. and strokes of from 50 to 100 mm.

For Multi-cylinder Engines, multiply by number of cylinders.

Bore in Millimetres.	Stroke in Millimetres.																									Bore in Millimetres.

QUESTION & REPLIES.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Climbing Powers of a 1¾ h.p. Machine.

[?] I am thinking of buying a 1¾ h.p. F.N. motor bicycle. I weigh nine stones, and should want it to take me up a hill about four miles long. I can ride it on a pedal bicycle. I should be glad to know if you think this machine powerful enough.—P.N.P.

We should say the machine in question would climb the gradient with ease if, as you say, you can manage it on a pedal bicycle.

A Question of Gear Ratio.

[?] I have recently bought a 3½ h.p. Brown motor cycle (magneto) which runs admirably in the country when I can let it go, but when in town or on greasy roads I find gear too high (3¾ to 1). I want it for use largely in getting to and from business, about one and a quarter miles through town and four in the country. What do you suggest as the best means of overcoming difficulty with least wear to engine, and also economy of original cost and running?—E.K.

Undoubtedly the trouble is due to the gear being too high. The cheapest way out of the difficulty is to fit an adjustable pulley, or to lower the gear and fit a clutch.

Motor Cycle Speedometers.

[?] Is there such a thing as a reliable speedometer for a 1908 Triumph motor bicycle? I presume it should register at least 45 m.p.h., as the machine has a 4 to 1 gear. The only one I know of is driven from the edge of the front wheel rim and registers only 30 m.p.h. This, of course, is useless, as the bicycle has a peculiar pattern of spring forks, and the mileage registered is too low. I should be greatly obliged if you could let me know of a good speedometer, and also where I can get a mirror to fix to the handle-bar?—W.H.C.

Good speed indicators are the Jones, sold by Messrs. Markt and Co., 6, City Road, E.C., and the Cowey, sold by the Cowey Speed Indicator Co., 1, Albemarle Street, Piccadilly, W. Both register up to fifty miles an hour. A nicely-finished handle-bar mirror can be obtained from Sprason Bros., St. George's Place, Great Hampton Row, Birmingham.

Even Running with Two Cylinders.

[?] I have a twin-cylinder 6 h.p. Riley water-cooled engine, trembler coils. I start the engine running at a certain rate, and one cylinder seems slower than the other. I take the wire from the front plug and the back cylinder fires at a good rate. Without moving the spark, air, or gas levers, I replace the wire to the front plug, but disconnect the back plug, and I find that the front cylinder is much slower than the back one. Please advise me how to get both cylinders running at the same rate? I have cleaned the platinum points of the coil thoroughly, and tried to remedy the fault by altering the adjustment of the screw, but as soon as I move it from one position, either forward or backward, the front cylinder will not fire at all. The accumulators are fully charged, and the plugs E.I.C.—L.H.S.

To synchronise the firing of both cylinders requires a little care when a separate trembler blade is used for each. The adjustment of the contact breaker screws naturally affects the speed also. Try the platinum screw for the front cylinder slightly harder on. If this makes no improvement we can only suppose the compression of the two cylinders is unequal, or the coil for the front cylinder needs attention. To determine if this is the case, change the wiring of the coils, *i.e.*, connect the present front cylinder coil to the back cylinder and *vice versa*. If then the back cylinder runs the slower, you will know the coil is at fault.

Worn Firing Cam and Dry Battery as a Standby.

[?] (1.) My 3⅜ h.p. Rex runs well on the level but is weak on hills. Everything seems in proper order, but I notice that the firing cam is rather worn. If I fit a new one would it improve the running? (2.) Is it possible to connect up to a two-way switch with one accumulator and one dry battery (trembler coil)? My idea is to run on the accumulator, and to have the dry battery as a stand-by.—J.A.

(1.) Probably if you fit a new firing cam it will improve the running considerably. (2.) It is quite possible to connect up a dry battery by means of a two-way switch to work with a trembler coil. The connections should be made in exactly the same manner as they would be for two accumulators.

In the long-distance trial for industrial vehicles in France, two Mototri-Contals completed the test with very little attention and at a very low running cost. They are shown above passing through Pont-sur-Yonne.

A Novice's Queries.

(1.) I have a 2½ h.p. Alldays. The 26in. wheels turn once to 5¼ turns of the engine pulley. Is that too high for a hilly district? Please tell me how to alter the gear if wrong? (2.) Would aluminium paint improve the appearance of crankcase? Do you recommend canvas and rubber belts?—A.C., Hastings.

(1.) The gear would be about right if your weight does not exceed eleven stones. If too high, you had better fit a smaller engine pulley. (2.) You can paint the crankcase with aluminium paint if you like, but we should not think it worth while. It is better to keep it clean by washing it with petrol. Canvas and rubber belts are quite satisfactory.

Advantages of Adjustable Bottom Air.

I have a 3 h.p. N.S.U. magneto, which is very hard to start, but when it is once off it goes perfectly, from a walking pace to thirty odd miles per hour. Do you think altering float needle would make any difference, as I have tried all ideas as to plug, shutting off air, and putting paraffin through cock? The engine starts well on the stand with one push down of pedal, but will not start on the road without a lot of exertion.—W.S.C.

Either you fail to put the spark lever in the proper position for starting on the road, or you do not close the extra air lever, or the spray is choked. You will find an adjustable shutter on the side of the carburetter. Almost close this before starting and open it immediately afterwards, and you will find that the engine will start much easier.

Adjustment of Magneto and Carburetter.

(1.) Kindly advise me on the following points: Where can I get some printed information regarding adjustment, etc., of the Eisemann magneto with coil as fitted to 1907 2¾ h.p. Minerva motor bicycle? The Minerva catalogue does not give the information I require. (2.) My carburetter (Longuemare) drips petrol from base of mixing and spraying chamber. I am told this can be stopped by grinding in the needle valve. Is this advice correct, and how should the needle be manipulated in order to grind it properly?—LC 5209.

(1.) The Eisemann system of magneto ignition is extensively dealt with in "Motor Cycles and How to Manage Them." If you find this information insufficient kindly write to us again. (2.) If the carburetter drips when the machine is standing, either the needle requires grinding in or the petrol level is too high. A good way to grind the needle valve in would be to fix the stem in the chuck of a small drill, put a little crocus powder mixed with oil on the seating and revolve the drill evenly and carefully, lifting it from time to time to avoid making any "rings" on the seating. Hold the drill perfectly upright. The point should prevent any petrol entering the chamber when fuel tap is turned on.

Speed in Hill-climbing.

I have a 3½ h.p. (80 by 80) Fafnir engine and carburetter in Chater No. 6 frame, trembler coil, automatic air valve on carburetter, gear 4⅝ to 1, 26in. wheels, m.o.v. I am unable to get up the hills in this neighbourhood, none of which are very stiff, at high speed; for instance, a 3 h.p. (75 by 80) machine, same make and gear, heavier rider, generally leaves me struggling far behind. Immediately I commence the climb the engine slows down and labours sluggishly up the hill. I generally manage to get up, but at nothing like the speed I should do. I have done the following: Set trembler to a good clear buzz, taken off the automatic air intake and fitted a cover to the hole, to operate with a lever and find engine will take all the air at any speed in addition to what it takes through three small holes which I have bored in the induction pipe. Examined timing and find spark occurs about ¼in. on down stroke when fully retarded. Charge carried about seven-eighths of the stroke. I have cleaned carburetter out, it floods and runs over at jet when valve is tickled. I cannot even on the level get engine really racing.—A.B.

You do not mention if you have tested the compression; if the valves need grinding you will not obtain much speed on hills. You might try the effect of a new and stronger exhaust valve spring, and see if any improvement is obtained. Also measure the amount of opening of the inlet valve. If more than ⅛in. reduce it to this amount. Lastly, we should be inclined to think the coil is not a high speed one. The contact breaker on your engine works better with a plain coil.

Crankcase Joints, Magneto Contacts, and Sidecars.

(1.) I have a 6 h.p. twin N.S.U., new last June. I recently took the engine down, and before putting it together I made fresh joints of brown paper and soaked them in linseed oil for a few hours, but after putting it together I find oil is thrown out. Can you tell me how to cure it? A friend has advised me to put fish glue between the joints of the crankcase and cylinders, as my engine was quite tight before I took it down. (2.) My machine has a high tension magneto. Will you tell me where are the platinum contacts on it, as I think they may want adjusting a little, as my machine is getting difficult to start? (3.) I am thinking of buying a new sidecar. Which would you advise me to buy, as I have never had anything to do with sidecars yet?—J.H.K.

The A.C.U. Open Hill Climb. H. Newey (3½ h.p. L.M.C.) approaching the top of Sutton Bank, which he failed to reach by only a few yards.

(1.) Brown paper soaked in boiled linseed oil is used by most manufacturers. If, however, your attempt has been a failure to render the crankcase oil-tight you might have another try, and if this is not successful use fish glue. (2.) Slide away spring which holds the contact breaker cover in position. This will reveal the platinum points; clean these up with a jeweller's file, brush away all filings afterwards with a clean brush soaked in petrol, and then try a new fibre ring, as the present one may be slightly worn. This can be obtained from the Bosch Co., 23, Store Street, Tottenham Court Road, W.C. Other hints on the care of the magneto will be found in "Motor Cycles and How to Manage Them." (3.) If you care to send us a numbered list of the sidecars which you think would suit you, keeping a copy by you for reference, we will place them in order of merit.

HINTS AND TIPS FOR MOTOR CYCLISTS.

By Road Rider.

(Continued from page 434.)

IGNITION TROUBLES.

(For high tension magneto, see previous paragraphs.)

1. Loose wire.
2. Wire snapped in two.
3. Wire broken under insulation.
4. Current shorting through thin insulation.
5. Terminals shorted by moisture or metal in contact with them.
6. Cells exhausted below 3.8 volts.
7. Sparking plug broken or short-circuited; the latter internally by cracked porcelain or mica, or externally by damp or carbon.
8. Contacts on contact breaker greasy, pitted, or missing. Short circuit at contact breaker by wet or lid of contact breaker bent. Bad earth return through camshaft. Adjustment of blade or screw slipped.
9. Connection on coil broken below terminal screw.
10. Blade of trembler coil stuck through pitting or maladjustment.

CARBURETTER TROUBLE.

An absolute stoppage due to the carburetter can only be brought about by a choked passage.

ENGINE TROUBLE.

For sudden stoppages, see if compression is good; if not—

1. A valve has broken.
2. A valve is prevented from closing.
3. Piston is broken.
4. Cylinder is cracked.

If engine is stiff or jammed—

1. It is near seizing from under-lubrication, or oil is bad. Loosen with paraffin, lubricate fully, revolve by hand till free.
2. It is sadly overheated.
3. Crankpin is bent.
4. Connecting rod is bent.
5. Some internal part has come adrift, *e.g.*, lockscrew of gudgeon pin; take engine down and examine, particularly timing gear and gudgeon fastenings.

A long list of paragraphs referring to unusual derangements are appended, but, as a rule, if the spark is present, valves working, and petrol reaching the carburetter, the machine will go.

AIR LOCK IN PETROL TANK.

224. Unless the stopper of the petrol tank be pierced with a fine hole stoppages will ensue through the spirit being retained in the tank by a vacuum. Every stopper should have a tiny hole protected by a baffle to prevent petrol spraying out when tank is full. A smart idea is to solder a small helmet or other lubricator over the hole.

BALL BEARINGS.

225. Balls are easily replaced in a dismantled bearing by lining it with grease. In adjustments, tighten cone till the bearing feels as tight as if it were solid, free from all vestige of movement, and then slack it back a quarter of a turn.

If a ball be broken or lost it is preferable to leave a ball out rather than fit one too large.

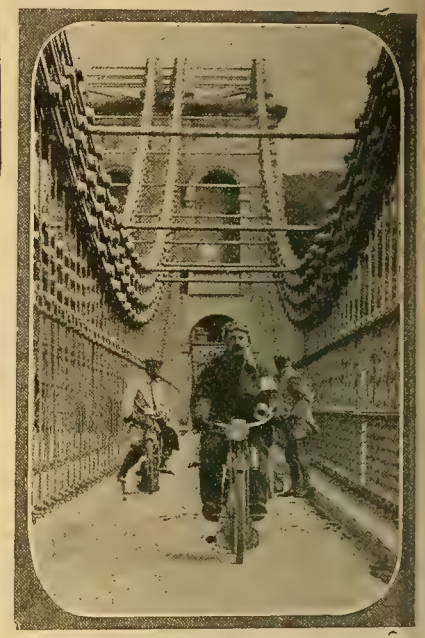
BUCKLED WHEELS.

226. There is no need to push or cart a machine because a wheel has been buckled, but if badly buckled the pace must be kept low. Remove wheel, use a stone as an anvil, and a big wrench as a hammer if a proper hammer is unobtainable. Hammer rather on each side of kink than on kinked portion itself. By these means the wheel can be made rideable, but on reaching a repairer it is advisable to have the wheel accurately trued and spokes tightened up or replaced. If rim is cracked get a new one.

CLEANING COACHWORK ON TRICARS.

227. The secret of keeping coachwork in a smart condition is to clean it promptly and to sop the dirt off.

Neither grease, dust, nor mud should be left on it till morning.



Three competitors in the Coventry-Holyhead 12 hours' run crossing Menai Bridge, the connecting link between Carnarvonshire and the Isle of Anglesea. The foremost rider is A. Wright.

No rubbing or scraping should enter into the cleansing process.

As soon as the night's destination is reached all dirt should be gently sopped off with a large carriage sponge, or with a very gentle douche pipe. For the last wash the sponge should be rinsed till it is absolutely clean. The coachwork should finally be dried with soft stuff, and polished with Selvyt.

CLEANING THE CRANKCASE.

228. Interior.—No lubricating oil is entirely free from impurities, and so the crankcase should be periodically flushed out with paraffin, to prevent some speck of foreign matter choking one of the minute oilways that carry lubricant to the bearings. Some engines are provided with a screw plug for paraffin injections; on others the pipe union must be disconnected. First run out all dirty oil, then inject one gill of paraffin; close openings to crankcase, and pedal engine round on the stand for ten minutes. Drain out paraffin, relubricate with four charges of engine oil, and pedal on the stand for a few minutes to work fresh oil into all bearings before the engine is run.

Exterior.—Motor cycles often leave an unpleasant smell behind simply because the warm crankcase is smeared with mud and grease. Swill the aluminium with waste petrol or paraffin, and scrub it with a stiff bristle brush.

(To be continued.)

M.C.C. London-Edinburgh 24 Hours' Run. Competitors arriving at the Wetherby control.

Being the opinions of medical men who are actual or prospective users of motor cycles.

(*Continued from page 459.*)

Cyril Howkins.

Motor cycling is, in my opinion, a most healthy pastime. One of the apparent drawbacks against it is the vibration. This has been shown to be greatly exaggerated, and is in no way injurious to health (*British Medical Journal*, 1907). It is one of the best antidotes to worry I know of, and to anyone of a mechanical turn of mind is a constant source of interest and amusement. The best type of motor cycle for a general practitioner depends to a certain extent on the size of his practice and the nature of the country. For a country district I consider that a 3½ h.p. of good make, magneto ignition, with a two-speed gear and free engine, would be most suitable.

Douglas Gray, M.B. Lond., M.R.C.S., etc.

Motor cycling is a source of great pleasure, and is an extremely healthy and invigorating pastime, always provided that the speed and length of journeys are kept within reasonable limits. At fast speeds it is not the vibration which is so much injurious as the constant tension of the mind

Dr. Douglas Gray.

always on the look out for possible dangers. I use the motor cycle a great deal in my practice, chiefly for the time saved in the long-distance visits on good roads. The cost of upkeep is almost negligible. Last year my bills came to £8 for 2,200 miles, including everything, licenses, petrol, repairs, etc. I use a 3¾ h.p. N.S.U., magneto, spring forks, two-speed gear, and free engine and Millennium stand. On no account would I be without the speed gear and free engine, and the stand is invaluable, as it does not require handling, but is operated instantly by the foot. I use a heavy high-powered machine, as the district here (Bolton) is hilly and the roads very rough. On good level roads a low-powered machine with free engine would be the thing.

C. B. Gervis, M.D.

Having ridden a motor cycle in my professional work for the last six years, my experiences may be of interest. For town work, or paying visits close to home, the motor cycle is not suitable, but for country work it is invaluable. Undoubtedly it is considerably cheaper than a car, or a horse and trap, and as healthy as either. For hilly districts I think the only suitable machine is one with a two-speed gear. Personally, I ride a 3½ h.p. Phœnix Cob, two speeds, and am very pleased with it; it will climb anything. The dropped frame is an advantage, as one can wear a long coat wrapped round the knees. For level country probably a lightweight machine would be sufficient.

E. J. Parry.

(1.) I consider motor cycling to be most beneficial to one's health, provided it is not overdone, and one has a first grade modern machine. One hundred miles per diem is sufficient for most people. (2.) I find a motor cycle of very great use in my profession, and always use it in preference to my small car whenever the weather permits. (3.) Upkeep of a motor cycle variable according to owner. (4.) I do not think one could find a more suitable machine for a doctor than the one I now possess, namely, a 3½ h.p. 1908 Triumph. One can always have a clutch fitted if one does not care to mount in the usual way.

Dunelmian.

(1.) I consider motor cycling a healthy pastime, especially for a town worker, but some other pastime in conjunction involving more exercise is desirable. (2.) Very useful, especially for a busy country practitioner. It is twice as fast as cycling, and three times as fast as riding or driving; hence it saves time and consequently fatigue. Have always found it reliable. (3.) The running expenses and cost of upkeep are infinitesimal compared with those of a horse. (4.) Speaking generally, the heavy powerful type for country use. A medical man must start his machine easily anywhere—the middle of a hill, in a field, or on a farmer's track, therefore high power, free engine, speed gear, and footboards.

F. Hall.

I find motor cycling in a medical practice much more satisfactory and cheaper than any other means of locomotion. A horse and trap cost me £100 a year, hiring a hansom about the same, whereas my motor cycle does not

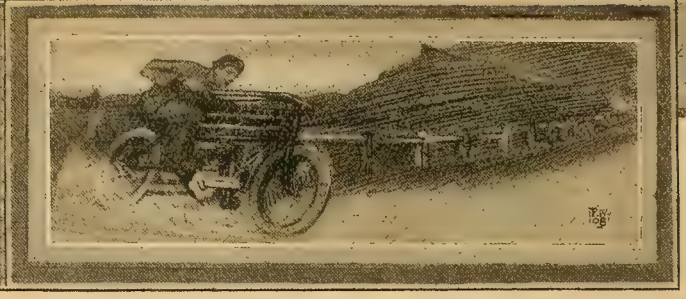
Dr. F. Hall.

cost me more than £15 a year. The rapidity of getting about is delightful, exhilarating, healthy, and gives one a longer time at home. A tricycle with a two-speed gear is better for a doctor than a bicycle, as he is busiest when the roads are at their worst, and I feel much happier since taking to a three-wheeler.

Surgeon (East Anglia).

A motor cycle saves time on a round, ensuring either more leisure or increase of practice, supplements a car, trap, or bicycle. A lightweight for mixed town and country work, a powerful twin with two-speed gear for hilly districts, and sidecar to convey colleague, nurse, and surgical impedimenta. Magneto ignition, spring forks, Rich's tubes, Palmer cords, and rubber belts. Easy replacement of spares of well-known make essential. Cost little more than push bicycle, but needs very little skilled attention with a little intelligent use and care. A Vindec twin with Castor wheel sidecar and a Moto-Rêve I find to be excellent steeds.

CURRENT CHAT.



Special Features

THE END-TO-END RECORD BROKEN.

A CUBICAL CAPACITY TABLE.

Growth of the A.A.

374 new members have joined the Automobile Association within the last three weeks.

Hill-climbing in Austria.

N.S.U. and Phänomen motor cycles gained first places in a hill-climb at the beginning of this month at Riederburg, some sixteen miles from Vienna. The course measured two and a half miles, with a rise of 638 feet. In the lightweight class Scheibert motor cycles occupied first, second, and third places.

Motor Cycle Racing at Lyons.

The Motor Cycle Club de Lyon is organising a race meeting for next Sunday, to be held on the road between Chères and Anse. The machines will be divided into four classes, and will be timed over a flying kilometre. A special prize of 100 francs (£4) will be awarded to the motor cyclist making the best time during the day.

An Attempt on the Hour Record.

Grapperon, the well-known Alcyon rider who has been figuring very prominently of late both on road and path, is now preparing for an attack on Guippone's world's hour record. Olieslagers is of opinion that the record will be difficult to wipe out, but Grapperon thinks otherwise, and as a result the pair made a bet, the former laying odds against the latter setting up new figures before the first of September.

The Length of Footrests.

Long low footrests are dangerous when taking corners at fast speed, as was proved at the A.C.U. Hill-climb at Sutton Bank. One or two competitors had long footrests fitted to their machines, and during the afternoon the left footrest of one machine caught in the ground while the machine was travelling at twenty miles an hour round the bend, and acting as a pivot spun the machine completely round.

French Grey Finish

Apropos of the leaderette in our issue of April 15th, from careful observations we have made recently, we are decidedly of opinion that French grey is the best colour for motor cycles, as it does not show the dust or dirt anything like black enamel or aluminium. A motor bicycle nicely finished in French grey looks just as smart as any other colour, and we are not the only persons of this opinion, for we have seen several new motor cycles finished in French grey recently.

More Military Motor Cyclists.

A volunteer motor cycling corps is to be formed at Vienna in connection with the Volunteer Motor Corps, both coming under the command of the Emperor's nominee. The two corps will support the army in the field and do orderly work. Members receive uniforms and compensation for consumption of fuel on the basis laid down for the elder body.

Motor Cycling in O.R.C.

Mr. G. Turner, M.M.S.S.R.E., Harrismith, O.R.C., informs us that a motor bicycle without a two-speed gear is useless in that part of the country. Harrismith being situated about 5,000 feet above sea level, our readers will readily understand that a considerable amount of climbing is necessary, and a photograph which Mr. Turner sends us shows high mountain ranges and very difficult country.

A Handsome Motor Cycling Prize.

The trophy illustrated is one which has been offered by the Palmer Tyre, Ltd., in connection with the York County Motor Cycle Club's twenty-four hours' reliability run to Edinburgh and

back on July 18th next. The cup will be presented to the rider who makes the best performance on Palmer tyres in the above event. The trophy is at present on view at the Triumph Co.'s depot, 4, King Edward Street, Leeds. Gold medals are offered by the club to all who finish within twenty-four hours.

End-to-End Record Broken.

Several hours were knocked off the Land's End to John-o'-Groat's motor cycle record last week by Arthur W. Bentley riding a 1908 Triumph. He started from John-o'-Groat's and finished at Land's End in a very fresh condition considering the strain he endured, the greatest discomfort being the irregular food.

Walking beside a Motor Bicycle.

It was once the prevalent opinion among motor cyclists that magnetos caused difficult starting, but in nineteen cases out of twenty sluggish starting is wholly and solely due to the carburetter. We recently tested a well-known 3½ h.p. motor bicycle that was in such perfect tune that it was possible to walk beside it with the engine firing regularly, and this with a gear of 4 to 1. Would that every new motor cycle turned out was as docile. Motor cycling loses some of its charms if the machine is a difficult starter, and there is no question of doubt that if all motor bicycles were tuned up to start and run at three miles an hour there would be thousands of new converts.

Police Traps.

A correspondent informs us that the police are very active in West Sussex. There is a trap on the Chichester Road between Midhurst and Cocking. It extends from about two miles from Midhurst to a point about a quarter of a mile from the village of Cocking. Motorists are generally accused of driving at twenty-seven miles an hour.

At Hambleton, about four miles from Selby, on the York and Selby Road, a quarter-mile trap has been started.

Between Garstang and Preston, a distance of ten miles, motorists are timed and checked by telephone, also on both sides of Lancaster. There are three traps within eight miles of each other.

At Stannington, on the Newcastle-Edinburgh Road, four miles south of Morpeth, and at Seaton Burn, two miles north of Gosforth. The Morpeth trap is from the start of the tar macadam road to the police station, going north. The Seaton Burn trap is from about 100 yards from the railway bridge over the road to the public-house on the extreme north end of the village. Over twenty motor cyclists were stopped during a recent week-end. Between Galgate and Lancaster, half a mile north of Galgate. The trappers are behind the hedge on the right hand side going north to Lancaster.

SHAMROCK-EXCELSIOR RUBBER STUDDED TYRES

AND

SHAMROCK-GLORIA BELTS

prove to be the most successful Tyres and Belts, and are **by far best represented** amongst the competitors on their arrival at Edinburgh.

N.S.U. MOTOR CO., LTD.,
78, Charlotte Street,
LONDON, W.

A Competitor for the End-to-end.

We recently stated that Mr. J. H. Hall, of Sheffield, would compete in the End-to-end run next month. This is incorrect; it is the new president of the Sheffield and Hallamshire M.C.C., Mr. F. Dover, who has entered for the run.

M.C.C. London-Edinburgh Run.

The committee of the Motor Cycling Club met on Monday last to go through the timekeeper's (Mr. F. T. Bidlake's) figures and decide the winners of the Schulte Cup and the special cup for motor bicyclists. Mr. C. W. Brown, writing in the *Nottingham Evening Post*, gave A. G. Reynolds as the probable winner of the Schulte Cup.

Open Hill-climb at Barnsley.

On Saturday next, on Stainborough Lowe, Barnsley, an open hill-climbing competition will be held for the Littlewood twenty-five guineas challenge trophy. From a contour of the hill we note the gradient at the start is 1 in 66 for 66 yards, then 1 in 22 for 66 yards, 1 in 10 for 166 yards, 1 in 7 for 333 yards, 1 in 6 for 100 yards, 1 in 22 for 66 yards, 1 in 9 for 233 yards, finishing with 66 yards of 1 in 20. The length of the hill is 1,100 yards, with a total rise of 320 feet, and the surface is in good condition. By kind permission of Capt. Wentworth, the competitors will return through the park back to the starting point. A telephone is being erected on the hill.

A New Road to Brooklands.

The entrance to the Brooklands racing course for both cars and motor cycles will, in future, be from the Byfleet Road, about a quarter of a mile nearer to Weybridge than the present entrance to the members' car enclosure. This new entrance will be in use on other days than race days. The motor course will be closed on Sundays until further notice. Foot passengers approaching the track on race days and non-race days will continue to use the present approaches.

"The Motor Cycle" Cubical Capacity Table.

The cubical capacity table published this week, pages 474 and 475, is the most complete table that has ever been published in connection with single-cylinder engines. It gives the bore in millimetres from 50 up to 90, progressing one millimetre at a time. The stroke is also given from 50 to 100 mm. progressing one millimetre at a time. It is, therefore, possible to find the cubical capacity of any engine on the market without any calculating, provided the bore and stroke are known. All the reader has to do is to find the bore, say 75 mm., which will be found in the vertical column in large figures headed bore in millimetres, trace along this line until the column indicating the required stroke is reached. The figure in the square at the intersection is the cubical capacity in centimetres. In the case of multi-cylindered engines, the figure in the square has merely to be multiplied by the number of cylinders. This table, printed on a stiff card, eyeletted and corded, suitable for hanging up in works offices, clubrooms, garages, motor cycle depots, etc., can be obtained from *The Motor Cycle* Offices, 20, Tudor Street, E.C., and Coventry, for 6d. post free.

The M.C.C. Team Competition, June 27th.

In addition to the eight clubs already mentioned, we understand from Mr. J. Van Hooydonk, the trials hon. sec. for the team competition, that two other clubs are almost certain to enter before Saturday next (the closing date), viz., the Manchester M.C. and the Oxford Bocardo M.C.C.

The Motor Cycle silver challenge cup has now been contested for on three occasions, and it is instructive to recall the number of miles covered by members of the winning teams without a stop: 1904, Coventry M.C.C., 485 miles; 1906, Motor Cycling Club, 457½ miles; 1907, Coventry M.C.C., 534 miles. The course measures 100 miles, and six riders represent each club team. Entries definitely close on Saturday next, the 20th inst., the trial being fixed to take place on the following Saturday, starting from Daventry, Northants.

FUTURE EVENTS.

June 20—Entries close for M.C.C. Team Competition at Daventry.
" 20—Barnsley Victoria C.C. (Motor Section) Open Hill-climb for Motor Cycles.
" 24—London United Tramways Five Miles Tourist Motor Cycle Handicap at the Stadium.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective Competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., Liverpool M.C., North West London M.C.C.; Sheffield and Hallamshire M.C.C.; Manchester M.C.; and Bocardo M.C.C. (Oxford).
" 27—Motor Cycle Union of Ireland Inter-centre Contest for the Triumph Cup.
" 27—Scottish Twelve Hours' Open Reliability Trial.
" ——A.C.U. 24 Hours' Ride.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 6-7—A.C.F. Grand Prix Races for Cars and Voiturettes.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
" 25—Motor Cycling Club Petrol Consumption Tests.
Aug. 8—Essex M.C. Open Race Meeting at the Stadium.

Successful Machines in the London-Edinburgh Run.

The following will give an idea of the great reliability of the various popular makes of motor cycles in the London-Edinburgh twenty-four hours' ride. Of the twenty-six Triumph riders who started, twenty-one reached Edinburgh to schedule time, fifteen Vindec Special riders started and twelve finished, nine Rex started and eight finished, four Minervas started and three finished, four Bats started and three finished, four N.S.U. started and two finished, three Matchless started and all three finished, while two Moto-Rêves started and both finished. Among the passenger machines three out of four Lagondas which started reached Edinburgh within the allotted time.

Two-speed Gears in the End-to-end.

If any entrant for the A.C.U. Land's End to John-o'-Groat's Trial is desirous of fitting a two-speed gear, we know of a firm which is anxious to supply an engine shaft gear for use in the above event. Letters addressed "Two-speed Gear, c/o the Editor," will be forwarded to the right quarter.

Chichester Motor Cycle Race.

The winner of the three miles open handicap held in Priory Park, Chichester, on Whit-Monday, was P. R. Dowson (85 by 60 mm. J.A.P.), time 5m. 20s., prize silver goblet; 2, J. R. Belcher (70 by 76 mm. J.A.P.), prize dinner gong. There were six competitors. The track is grass and five laps to the mile.

Imports and Exports of Motor Cycles.

Imports of motor cycles and parts during last month were valued at £6,500, as against £9,398 in May, 1907. The five months' figures were £29,783 this year, £41,606 in 1907, and £41,642 in 1906. The exports of British machines during May were valued at £3,859, as compared with £5,327 in May, 1907. For the five months ended 31st May £21,646 worth of motor cycles and parts were exported this year, £23,624 worth in 1907, and £21,267 in 1906. Re-exports of foreign motor cycles reached the value of £3,913 during the first five months of the present year.

No more Hill-climbs at Sharpenhoe.

No more hill-climbing contests will take place at Sharpenhoe, for the fiat has gone forth that henceforth permission for competitions will be refused. All motor cyclists in the district, as well as hotel proprietors, refreshment caterers, and the majority of the villagers, regret the decision of the authorities.

Another Rubber-studded Tyre.

A new British made rubber-studded tyre for motor cycles will shortly be placed on the market.

Schulte Cup Competitors.

Mr. J. O. M. Dixon (3½ h.p. Vindec), a competitor in the M.C.C. London-Edinburgh and Schulte Cup competitions, informs us that owing to having lost his way near Haddington, and having experienced a choked carburetter, he arrived at Barnet 1h. 50m. late, not reaching that town till 12.40 a.m. Beyond the above-mentioned experiences he completed the double journey satisfactorily.

Entries for the End-to-end Run.

At the end of last week the entry list for the A.C.U. Land's End to John-o'-Groat's Run, July 13th to 18th, totalled twenty-six. In addition to those given last week the following have been received: R. W. Duke (3½ h.p. Triumph), W. W. Douglas (2¾ h.p. Douglas), P. Phillips (2¾ h.p. Douglas), B. H. Davies (6 h.p. Advance with sidecar), E. Gwynne (5 h.p. Vindec Special), W. H. Outwin, J. Marshall, J. Slaughter, P. Cockroft, A. Manning Lomax, and H. C. Hanrott, all on 3½ h.p. Triumphs.

END-TO-END RECORD BEATEN.

DURING the last four years the honour of holding the Land's End to John-o'-Groat's record has remained in the hands of Mr. Harold Williamson, who, riding a 3¼ h.p. Rex, on July 30th, 1904, bettered Mr. G. P. Mills's splendid performance on a 3 h.p. two-speed Raleigh by 2h. 10m. From that time till last Wednesday no further End-to-end "record" rides were made, though occasionally

Arthur W. Bentley, who broke the Land's End to John-o'-Groat's record last week, riding a 1908 Triumph. His time was 41 hrs. 28 min.

rumours of attempts and failures reached us. Now the victor's laurels rest on the brow of Mr. Arthur W. Bentley, an enthusiastic amateur rider, who, mounted on a standard sealed 3½ h.p. Triumph, lowered Williamson's record by 7h. 8m., having accomplished the ride in 41h. 28m., and also beating the car record which stands at 42h. 5m.

The Start.

Starting on Tuesday, the 9th inst., at 2 a.m. from John-o'-Groat's, in the light of the early morning, the gallant rider was dispatched from that picturesque corner of Caithness, where it never gets dark at this time of the year, by Mr. D. K. Hall, whose name as a timekeeper is not unknown to motor cyclists, and excellent time was made along the good roads of the extreme North. News of the ride had got abroad, and even in Wick many people were about to give him a cheer as he rode southward. Berriedale, however, nearly proved his undoing, as Bentley never realised the severity of that sharp corner of this hill of hills, and only presence of mind and skilful riding saved him from rushing over the precipice into the sea. At Beauly an excellent early breakfast was provided, and here Mr. Bentley's brother and Mr. A. M. Lomax both met him and followed him for some distance. Both Mr. H. M. Bentley and Mr. Lomax were competitors in the M.C.C. London-Edinburgh run, and the latter, who had trouble with his magneto armature, got the defective part replaced, and though he failed in the aforesaid competition, he hurried to the North and rendered the aspirant to the record valuable assistance by giving him three butt-ended tubes. As he journeyed southward Bentley rapidly gained on his schedule, despite the fact that he experienced three punctures caused by long nails. The road over the Grampians was greasy at first, and then rough, but fair on the whole, and there was no wind to speak of at this stage of the journey. Refreshment was taken at Perth, and again at Lockerbie, where a crowd gathered. This point was reached about 4 p.m. Messrs. Tatham and Draper, both competitors in the London-Edinburgh run, were to have met Bentley on Shap, but somehow or other they missed him, and he continued on his way alone till he reached Whitchurch at midnight, where his troubles began.

Hotel Proprietors and Belated Travellers.

Here arrangements were to have been made for dinner (the only proper meal he was to have had throughout the journey), but the assistant mistook twelve midnight for twelve noon, and after fruitless attempts to rouse the proprietors of several hotels the journey was continued alone in the dark, and from here be began to lose time. Three hours ahead of his schedule at Whitchurch, he rapidly fell back. It was pitch dark, and a slight rain was falling, as, supperless and fatigued, he tried to find his way along an unknown road against a strong headwind with his lamp burning badly. However, he struggled on till day broke at Bridgnorth. Gloucester was reached at last, and here L. W. Bellenger (a former exponent of the Quadrant) met him, and to him Bentley owes much of the success of his ride. At Gloucester the feeding arrangements again broke down, and nothing but some coffee could be obtained. From here to Launceston Bentley could give but a confused account of what happened. Faint from want of food and stiff after a fall during the night, he describes this section as a nightmare. After Exeter, Bellenger and a companion who were

A. W. Bentley nearing the end of his long ride.

following experienced some trouble, and had to stop, when, to their surprise, they saw Bentley tearing back in the reverse direction. One of them followed, and sent him again along the right road, when after

End-to-end Record Beaten.—

travelling a few miles, their trouble being set right, they found his machine jacked up, and he asleep by the roadside.

The Effects of a Good Meal.

Left for an hour to rest, he was revived, and continued to Launceston, where, after a good meal, he quite recovered, and made a splendid run to Land's End, which he reached about 6.28 p.m. on Wednesday. Unfortunately, near Truro he followed a car, which led him astray into the town, causing him with this detour, and the fact that while feeling unwell he travelled several miles back along the road by which he had come, to cover about 900 miles, instead of 888. The timekeeper at the start was Mr. D. K. Hall, and at the finish Mr. Samson Turner, of Penzance, who was checked by Mr. Hall, who travelled from John-o'-Groat's for that purpose. The total time was 41h. 28m. We have examined the actual machine, and have seen that the seals are intact. The only point in which the machine differs from the standard is that it possesses a capacious tank. It is in splendid condition throughout, while the tyres (the latest type of rubber studded Clinchers) show little signs of wear, and have stood magnificently. The only mechanical trouble experienced beyond the three nail punctures to which we have referred was a broken exhaust valve. The whole performance reflects the greatest possible credit on Mr. Bentley, who drove with consideration in towns and populous places and yet maintain a decent average, for piloting the machine so skilfully, and on the manufacturers for the success of their production. Had Mr. Bentley been properly looked after all along the route, he would undoubtedly have made much better time, but, despite the twenty-five hours without proper nourishment, he looks well. He enjoyed a good dinner on his arrival at Land's End, and a good sleep afterwards, though he was up betimes the next morning, took a walk before breakfast, rode to Penzance, and caught the midday train to London.

Group of competitors in the North-west London Motor Cycle Club's speed-judging competition outside the Duke of York, near Potter's Bar.

Motor Cycle Racing at the Stadium.

INCLUDED in the programme of the Essex Beagles C. and A.C. at the Stadium at Shepherd's Bush on Saturday last was a ten miles motor cycle handicap, limited to machines fitted with engines not exceeding 76 by 76 mm., or the equivalent volume swept out. For this event nine entries had been received, necessitating two heats and a final, the preliminary heats being of five miles. In the first heat the starters were: C. E. Bennett (2¾ h.p. Mansfield), 76 by 75 mm., scratch; H. Martin (2¾ h.p. Matchless), 85 by 60 mm., 10s.; T. A. Carter (2¾ h.p. Matchless), 76 by 76 mm., 12s.; and G. H. Gerhard (2¾ h.p. Brooklands), 76 by 73 mm., 15s. Gerhard maintained his lead for about one mile, when he was passed by Martin, who, however, at the end of three miles gave place to Bennett, and a splendid race ensued between these two, Bennett ultimately winning by 150 yards. Time, 6m. 9⅖s. Bennett's nett time, 5m. 54⅖s. The second heat, for which five names were on the programme, only produced two starters: H. V. Colver (2¾ h.p. Matchless), 76 by 76 mm., 5s.; and A. P. Tyler (2 h.p. Chater-Lea), 70 by 70 mm., 20s. This heat furnished another most interesting race, Tyler maintaining his lead until just entering the last lap, when Colver managed to overtake him, eventually winning by about 80 yards. Time, 6m. 54s. Actual time, 6m. 39s. The final, which was run off over ten miles, resulted as follows:

1. H. Martin, 20s.
2. C. E. Bennett, scratch.
3. H. V. Colver, 10s.

A. P. Tyler, 40s., retired.

This provided a most exciting race between the above riders, Tyler soon being overhauled by Martin, who appeared to be getting away from the scratch man, Bennett, who, however, at about half-distance nearly caught him, but soon after perceptibly slowed, and lost considerable ground, which he was unable to make up, Martin ultimately winning by half a lap, Colver a lap to the bad. Time, 12m. 18⅘s., Bennett's actual time being 11m. 58⅕s.

The new regulations prevented photographers taking a camera inside the grounds on Saturday last. We are, therefore, unable to give any pictures of the racing.

A.C.U. NOTES.

ELECTIONS.—At a recent committee meeting of the A.C.U. sixteen new members were elected.

AFFILIATIONS.—The most recent affiliations comprise the Halifax and District, the Purley and District, and the Sutton Coldfield Motor Cycle Clubs.

PERMITS.—Permits have been granted to the Barnsley Victoria C.C. to hold an open motor cycle hill-climb on the 20th inst., for the *Sport and Play* race meeting at Birmingham, to the New Chesterton Club to hold motor cycle races at Cambridge on July 4th and July 9th, and to the Guildford C.C. to hold motor cycle races at Guildford on August 3rd.

LONDON TO PLYMOUTH AND BACK.—It has been decided to hold this competition, which will be open to the members of the A.C.U. and to those clubs affiliated to it. The details will be arranged by the Competitions Committee.

WOODFORD MEET.—The Auto Cycle Union has decided to award a prize to the rider of the best decorated motor bicycle. The Union has also decided to extend its patronage to the Travel Exhibition, which will be held at Olympia during June and July next year.

COUNCIL MEETING.—The next council meeting will be held at Warwick in September. One of the items on the agenda will be the 5s. scheme for unattached riders.

CLUB NEWS.

Burton-on-Trent and District M.C.C.

The above club held a successful run on Whit-Monday to Market Drayton, where an enjoyable time was spent in the grounds of a member.

Nelson and District M.C.C.

We are informed that a new motor cycle club has lately been formed under the above name. Prospective members should apply to Mr. J. H. Eaves, 20, Water Street, Nelson.

Nottingham and District M.C.C.

About twenty turned out for the inaugural run to Newark last Saturday. The first meeting of the committee was held on the 3rd inst. at the Lion Hotel, Nottingham. Mr. J. Elliot Littlewood was elected chairman. The annual subscription was fixed at 2s. 6d., with entrance fee 5s. after this the first year.

Applications for membership should be addressed to Mr. C. A. A. Spring, 19, Stratford Road, W. Bridgford, Nottingham.

Shamrock M.C.C. (Belfast).

A petrol consumption trial was held on Saturday, the 6th inst., over a course of fifty-one miles, the start and finishing points being at the Central Hotel.

The placings were as follows: 1, James Miller (2¾ h.p. Peugeot), weight propelled 336 lbs., amount consumed 3 pints 7 ounces; 2, W. Bailie, weight propelled 332 lbs., amount consumed 4 pints 7 ounces; 3, David Morton, weight propelled 343 lbs., amount consumed 5 pints 10 ounces.

Walthamstow M.C.

Motor cyclists are reminded of the Woodford meet of motorists and cyclists on Saturday, June 20th, and are specially invited to take part in the procession which will start from the grounds of Park House, Blake Hall Road, Wanstead, at 4.25 p.m. sharp on that day. Judging of costumes at 4 p.m. Prizes will be given for the best decorated motor cycle (with or without passenger attachment), and any driver or rider in the procession will be eligible to compete. Further information will be sent if application be made to the chief motor marshal, Mr. W. H. Applebee, Church Hill, Walthamstow. Tea will be served at the Bull and Crown, Chingford.

Ayr and District M.C.C.

A very successful hill-climbing competition was held on Rotterhill Brae last Wednesday evening, the 10th inst., and the results based on formula were:

	Figure of Merit.
M. Brown (1¾ h.p. F.N.)	34.1
W. McFarlane (3 h.p. N.S.U.)	37.3
J. Grier (2 h.p. De Dion)	40.4
J. McClure (3½ h.p. Triumph)	42.7
W. Allan (3 h.p. Triumph)	43.8
J. Robertson (3½ h.p. Minerva)	47.0
J. R. Johnstone (3 h.p. Fafnir)	49.1
J. Allan (2 h.p. Minerva)	49.3
D. Milligan (4 h.p. Werner)	50.5
A. Morton (3 h.p. Antoine)	62.0
G. Cocker (5 h.p. Rex)	63.2
H. Andrew (3½ h.p. Minerva)	63.5

Competitors were allowed three ascents of the hill, the best time to count. The fastest ascent was made by G. Cocker, in 30⅕s., for which a special prize was given.

Falkirk and District M.C.C.

On Whit-Saturday a hill-climb was held on Auchengean Hill. There were eighteen entries. Results: Class I.—

	Position on formula.	Time.
A. B. Blane (1¾ h.p. F.N.)	1 ...	40⅖s.
A. Muirhead (2¾ h.p. F.N.)	2 ...	35⅖s.
R. F. Salvesen (3½ h.p. Triumph) ...	3 ...	24⅖s.
A. G. Bostock (3½ h.p. Triumph) ...	4 ...	25⅖s.
G. Salvesen (3½ h.p. Triumph) ...	5 ...	25s.
F. Salvesen (3½ h.p. Triumph) ...	6 ...	25s.
C. Malley (1¾ h.p. F.N.)	7 ...	43⅕s.
E. Luthardt (3½ h.p. N.S.U.)	8 ...	30s.
Dr. Shanks (3½ h.p. Quadrant) ...	9 ...	35⅖s.
D. Cousins (3½ h.p. Excelsior) ...	10 ...	40s.

Class II. (multi-cylinders).—D. F. Bostock (6 h.p. N.S.U.), position on formula 1, time 22s.; J. C. Baird (5 h.p. Rex), position on formula 2, time 25⅖s.

Leeds M.C.C.

There were twenty-four starters in the Edinburgh and back run on Saturday, and the following riders duly finished within twenty-four hours.

F. W. Greenwood (3½ h.p. Rex), G. E. Tennant (5 h.p. Vindec), J. Percival, A. H. Hyde, H. D. Shaw, and Eric Myers (all on 3½ h.p. Triumphs). The result will be ready for next issue.

Sheffield and Hallamshire M.C.C.

The recent competition at Castleton had to be postponed until July 4th owing to a severe thunderstorm on the original date.

Next Saturday, the 20th inst., the annual reliability trial will be run from Sheffield to Bridlington and back. Three prizes are offered, and all competitors who complete the journey in twelve hours will receive a bronze medal.

Lincolnshire M.C.C.

Over two courses, each 125 miles, and equally difficult, the reliability trial of the Lincolnshire Club was run on Whit-Monday. The competitors were started simultaneously from Grimsby, Louth, Scunthorpe, Lincoln, Grantham, Stamford, Sleaford, and Lincoln at 8.30, and took the circular courses left hand inside. The rider adhering closest to his own schedule of time throughout wins the handsome silver vase held by Mr. E. R. Cole, Roxholme. Non-stop runs were claimed by the following:

North Route.—J. Mears, Scunthorpe (Motosacoche); A. Heseltine, Scunthorpe (twin Rex); J. R. Guessford, Scunthorpe (3 h.p. Glandford-Fafnir); S. G. Clarke, Louth (Rex); and W. H. Quine, Lincoln (3 h.p. Peugeot).

South Route.—C. Draper, Bracebridge (2¾ h.p. Minerva); J. Kirby, Lincoln (3 h.p. Lincoln Elk); A. Harrison, Lincoln (3 h.p. Lincoln Elk); C. C. Williams, Lincoln (3½ h.p. N.S.U.); R. N. Morley, Leadenham (3½ h.p. Brown); E. R. Cole, Roxholme (3½ h.p. Brown); and J. A. Mettham, Grantham (3½ h.p. Minerva).

Syston Hill-climb.

Coming in holiday week, the entry for the Lincolnshire M.C.C.'s hill-climb on Thursday in Syston Park, kindly lent by Sir John Thorold, Bart., was not quite so large as usual with this club. The arrangements were in the hands of the Grantham Centre. The best times are:

H. Gaunt (Motosacoche) making a good ascent.

Class 1 (under 3 h.p.)—H. Gaunt (1¼ h.p. Motosacoche), 1m. 27⅘s.

Class 2 (3 h.p. and over).—Alan L. Shaw (3½ h.p. Minerva), 58⅕s.; G. Williamson (3½ h.p. Minerva), 59⅗s.; A. E. Brunning (3 h.p. Dene-Fafnir), 1m. 22s.; G. J. Wilkinson (3½ h.p. Elk), 1m. 23⅘s.; and H. Gaunt (1¼ h.p. Motosacoche), 1m. 24⅗s.

Class 3 (twin-cylinder machines).—W. J. Clarke (5 h.p. Rex), 44⅕s.; R. C. Holland (6 h.p. Jap), 54⅗s.; and P. Pell (5½ h.p. Rex), 1m. 2⅗s.

North-west London M.C.C.

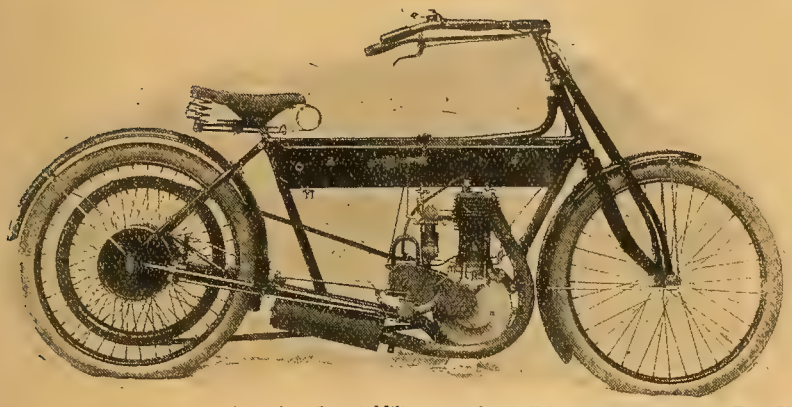
This club held a speed-judging contest on Saturday last. The course was from the Duke of York (near Potter's Bar) to the top of Digswell Hill (between Hatfield and Welwyn) and back, the total distance being twenty miles.

Place.	Rider and machine.	Speed.	Error.
1.	G. Rowden (3½ h.p. Bat)	17 m.p.h.	11s. slow
2.	F. Thomas (5 h.p. G.O.K.) ...	16 ,,	1m. 21s. ,,
3.	F. Fox (3½ h.p. Quadrant) ...	17 ,,	1m. 30s. ,,
†.	A. S. Phillips (5 h.p. Vindec) ...	16 ,,	2m. 29s. ,,
†.	C. G. Myer (9 h.p. Bat)	15 ,,	2m. 29s. fast
5.	W. C. Davenport (3½ h.p. Phœnix)	15 ,,	2m. 46s. ,,
6.	H. V. Davidson (3 h.p. Werner)	18 ,,	3m. 14s. slow
7.	G. H. Hollis (3½ h.p. Triumph)...	16 ,,	3m. 34s. fast
8.	E. W. Brighten (2½ h.p. Ariel) ...	19 ,,	4m. 19s. ,,
9.	C. Preen (4½ h.p. Minerva) ...	18 ,,	5m. 38s. ,,

† Tied for fourth place.

THE ROC

"The car on two wheels."



Changing old ideas of motor cycling. Demonstrated its capacity at Sutton Bank. The standard touring ROC machines entered were ordinary roadster standard models, and in no sense specially prepared.

4 h.p. New Royal Military model, ball bearing engine, with Roc Clutch, hand starting, and Roc speed gear, **48 guineas.**

ROC CLUTCH AND GEAR CONVERSION SET, 10 GNS. (adaptable to any make).

NOTE.—The ROC with live axle is the key to the future of motor cycles. NOTE also the Duplex tanks, the Duplex frame, the comfortable low riding position, the efficient silencer—the car like design.

Telephone—5712.
Telegrams—

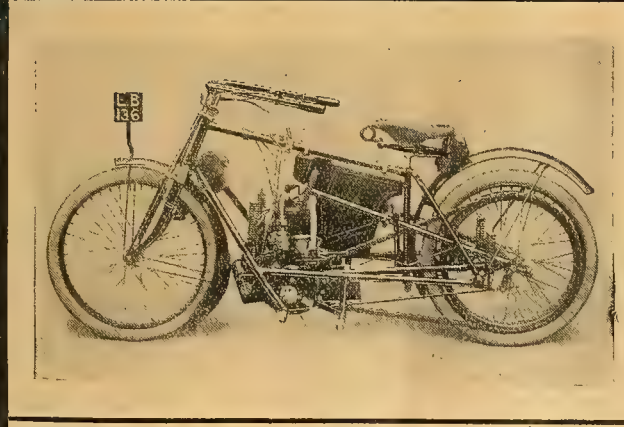
Aston Road and Dartmouth Street. BIRMINGHAM.

Illustrated booklet describes these machines.



THE ZENETTE WITH Gradua Gear.

What riders say about it:

Messrs. Zenith Motors, Ltd. 20th May, 1908.

Dear Sirs,—I have to express my complete satisfaction with the 'Zenette' with 'Gradua Gear.' I gave up a practically new machine of first-class make simply because I wanted more comfort on the long journeys I have to take. I went for a 70 mile run yesterday and returned feeling perfectly fresh, and not in the least stiff. The gear enabled me to soar up River Hill, and has quite proved its reliability and practicability. As tests, I tried last week stopping and restarting on the steepest parts of Brockley Hill and Netherhall Gardens, in both cases most successfully.

Believe me, Dear Sirs, etc.

25/5/08

Dear Sirs,

I think you would like to hear I am pleased with the Zenette I bought from you this last Easter. I have now ridden close upon 1,300 miles, and given it a thorough trial, and have nothing but praise to give you. I am a hard rider, riding nearly every day, and since 1902 have had many motor bicycles, but none of them come up to the Zenette. I think the control and steering is perfect, and in traffic I can go at a walking pace with your 'Gradua' Gear, and stand still with the engine running, and without getting off start again, not having to dismount and then run and jump on, as in the old days. Up hills it flies, but if wanted will either crawl up or go at a comfortable speed, and will start in the middle of a steep hill. I certainly would not be without your 'Gradua' Gear now I have once had a machine with it, and I say the same in regard to the spring frame; it is as comfortable as a car; and another thing I like is the way it will turn in any ordinary road without stopping the engine or dismounting. Yours truly, etc.

What the Press says about this unique mount:

The Daily Telegraph (Motor Editor) says: "The 'Zenette' double-spring frame is quite unique. It is designed to give absolute immunity from vibration to the rider, and it consists of two members pivoted horizontally about the centre, so as to be capable of angular movement in a vertical direction, like the limbs of a pair of scissors. The members are of a somewhat rectangular design, and are connected at each corner by tension and compression springs. The back wheel and the engine, etc., are carried on the one member, and the front wheel and the driver on the other; but any shock to the front wheels does not act directly on the rider, as it is intercepted by a central hinge between the two members, and is absorbed there by the action of it, which becomes raised or depressed as necessary. This action is entirely compensating, and the running is, therefore, most luxurious."

The People (Motor Editor) says: "My readers will probably remember that the Zenith Motor Co. have specialised for some years past in the matter of spring frames for motor cycles, and it was that particular point of the machine which I was most anxious to test. Let me say at once that the spring frame was *a great success*. In the old days I had a rigid frame machine, but had to give it up owing to the vibration transmitted to my poor body from the inequalities of the road surface, and my recent ride fully demonstrated to me that the one great objection to the smallest form of automobile had been *done away with entirely* by the four-coil springs—two in front and two behind—fitted to the 'Zenette.' As for the variable gear—known as the 'Gradua'—I have nothing but praise for it, too. I think the gear will prove *an unqualified success*."

TRIAL RUNS OF THIS MAGNIFICENT MACHINE MAY BE HAD (BY APPOINTMENT ONLY).

ZENITH MOTORS, LTD., 119, Stroud Green Road, LONDON, N. (Station: FINSBURY PARK)

THE BIRMINGHAM DAILY MAIL

OF JUNE 10th, 1908,

in an article on the modern motor bicycle, condemns the heavy, noisy, nerve-racking cycle monstrosity, and further says:

a
a com ..y below the figure
..., n many cases it might prove a doubtful bargain. But what is likely to command popular attention in the near future is a kind of detachable motor-cycle, for which numerous advantages are claimed. The whole of the motor mechanism can be easily removed, so that the machine can then be ridden as an ordinary bicycle. It is 1¼ h.-p., though the Automobile Association rate it at 2¼; it is also light, and yet can conveniently carry a weight of 13 or 14 stone. In
a few of these

Club News.—

Brighton and District M.C.C.

We are informed by the hon. sec. of the above that it is the club's intention to admit associate members at a subscription of 4s. per annum.

Lincolnshire M.C.C.

The meet on the 4th inst. was at Southwell. Mr. J. A. Mettham, hon. secretary of the Grantham Centre, showed the members over the Cathedral, and a most interesting time was spent.

Cardiff M.C.

To-day (Wednesday) a speed-judging competition will be held from Ely on the main Cowbridge Road to the last milestone (near railway bridge) the Cardiff side of Bridgend, and return by same road to the milestone at top of hill outside Cowbridge.

Worcestershire M.C.C.

The first annual hill-climb is fixed for the 20th inst. There will be two classes—one for single-cylinder machines and one for twin-cylinder machines. Two prizes are offered in each class, and Mr. Harry Lucas has kindly offered a special prize for the rider making fastest time. The hill selected is one mile in length, but the *venue* will be kept secret. Results will be worked out on formulæ. The following day the run is to Cleeve, and on the 27th inst. to Stratford-on-Avon.

Coventry M.C.

The results of the Coventry to Holyhead run of the above club on May 30th were made known at the committee meeting last week. The awards were a medal for first and a prize each for second and third. Competitors had to adhere to a mean average speed of 19 m.p.h. over the three sections of the route—Coventry to Llangollen, Llangollen to Menai, and Menai to Holyhead; in addition there were several surprise checks. The three awards were all taken by car competitors, the first motor cyclist being A. B. Jepson (3½ h.p. Triumph) with 18¼ bad marks; second motor cyclist, John V. Pugh (3½ h.p. Lloyd), 19¼ bad marks. The difference between the winning car and the first motor bicycle was only 1¼ bad marks, so it will be seen how keenly the event was contested.

Basingstoke and District M.C.

A reliability run of fifty-eight miles to Staines and back drew eleven entries, but only seven started. Ten checkers were placed at various points along the route, a minimum and maximum time being allotted for each section. The results were :

		Marks.
1.	M. Carpenter (3¼ h.p. Rex)	37.03
2.	J. E. Pool (3¼ h.p. Rex)	30.63
3.	F. Baron (3½ h.p. Brown)	26.82
4.	R. Joice (2 h.p. Minerva)	22.94
5.	Dr. F. R. Holmes Meyrick (10-12 h.p. Argyll car)	7.12

Also competed : K. Jones (4½ h.p. Minerva) and R. K. Hubbard (3¼ h.p. Rex).

Naval Motor Club.

A hill-climbing competition took place on Hyden Hill, near East Meon, on Whit-Monday, for naval officers, with the following result :

	Figure of merit.	Time above scratch.
SINGLE-CYLINDERS.		
Lieut. Hearn (3½ h.p. Triumph) ...	91 ...	9s.
Lieut. Ballantyne (3½ h.p. Triumph) ...	87 ...	12s.
Lieut. Townshend (3½ h.p. Triumph) ...	83 ...	3s.
H. M. Boxer, R.N. (3½ h.p. Triumph) ...	79 ...	scratch
Sub-Lieut. Tufnell (3½ h.p. Quadrant) ...	76 ...	8s.
Lieut. Bostock (3½ h.p. Triumph)	69 ...	13s.
MULTI-CYLINDERS.		
Lieut. Tracy (4½ h.p. F.N.)	78 ...	11s.
Dr. Turner, R.N. (4½ h.p. F.N.)	70 ...	17s.
Lieut. Davis (5 h.p. Rex)	68 ...	scratch
Sub-Lieut. Hutchison (5 h.p. Vindec) ...	58 ...	20s.
Lieut. Mackinnon (5 h.p. Rex)	49 ...	35s.

Fastest single-cylinder, 1m. 29s.; fastest multi-cylinder, 1m. 17s.

Lieut. A. F. G. Tracy, R.N., the winner of the multi-cylinder class, is the hon. secretary of the club. Several intending competitors were unable to be off duty, and others arrived too late to weigh in. (See page 473.)

A good idea of the acute bend half way up Sutton Bank can be gained from this illustration.

The rider is Captain Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph), and he is seen about to tackle a gradient of 1 in 6·10.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The A.C.U. Hill-climb.

[3355.]—I note that in your account of the A.C.U. hill-climb my machine (Scott) is referred to as 3½ h.p., and wish to point out that the engine is 3 h.p. only, and was entered in Class 7 as such. As you will see by the cylinder dimensions (twenty cubic inches total displacement), the engine is actually the same size as those generally classed as 2¾ h.p.

It might be interesting to draw attention to the fact that the total weight of the engine is 37¾ lbs., which is probably about half the usual weight of engines of this power.

ALFRED A. SCOTT.

Repairing Broken Pistons.

[3356.]—I thoroughly agree with what Mr. W. Merritt says regarding Mr. B. H. Davies's experience with an exhaust valve head punching its way through the head of the piston. If it is of any assistance to the readers of your excellent paper to know how a piston with a broken top may be cheaply and thoroughly repaired, and, in fact, made as new, I should like to say here how I made a repair to an engine of 3½ h.p. which I possess. The exhaust valve head broke off when running at a high speed, and falling into the cylinder, as in Mr. Davies's case, it punched a slot through the piston, and falling into the crank case it lay at the bottom. I removed the piston and took it to a foundry, where a new piece was "burnt" on. This is a process which some firms specialise in. The metal by this process is united as if it had never been broken, the surrounding metal being brought to almost fusing point before the new is poured in. The piston was then put in the lathe and roughly "skimmed" up again. I think Mr. Merritt is right in saying that there is no feature in your excellent paper which is more enjoyable than an article by Mr. Davies.

HUGH L. MILLER.

Transmission on Sidecars.

[3357.]—What other motor cyclists do is of interest to me. Perhaps what I do may interest others.

I own a 3⅜ h.p. Rex—a capital mount—and a Montgomery sidecar. I never go over fifty miles an hour, nor do I climb anything steeper than 1 in 2. But in our little runs about Norfolk and Suffolk my passenger and I have a good time, and always "get there," though not always without some pedal assistance. She says, "a little pedal assistance." Solo I drive with a ⅞in. Continental (rubber) belt, gear about 4¾ to 1. This belt is the cleanest one I know; it wears well, and the drive is like velvet.

When using the sidecar I put on a ¾in. Whittle (leather and steel) belt. This drops the gear to about 5¼ to 1 without the trouble of altering the "Albion" adjustable pulley. The little vibration set up by this belt is not particularly noticeable with the combination. This belt seems to me to meet the case well; it is stronger than the rubber and not so harsh as a chain

I am still looking for a good belt fastener for rubber belts. I use Riches detachable tubes and have nothing but praise for them.

REUB. G. NORMAN.

Touring Machines and the Weight Question.

[3358.]—We read with interest the article entitled "Touring Machines—The Weight Question," signed "C. E. T.," and should like to make one or two comments upon the remarks of your contributor *re* lightweight machines. He admits that a good trial of one of the latest twin-cylinder lightweights leaves little to be desired in smooth running and hill-climbing powers, but states that road vibration is particularly noticeable. If your contributor bases his remarks upon a lightweight machine, built upon ordinary cycle design lines, then we are hardly surprised, but let him try a Moto-Rêve, which is built up on proper motor cycle lines, *i.e.*, (1) a good long wheelbase, 52in.; (2) genuine motor cycle tyres; (3) a low frame with comfortable riding position; (4) a comfortable saddle 30in. from the ground; (5) long handle-bars with comfortable depressed grips; and (6) adjustable footrests. "Aye, there's the rub," and we venture to predict a very much more comfortable ride! But with the machine fitted up as above, it is still in every sense of the word a lightweight machine (85 lbs.).

As regards ease of control, your contributor suggests, himself, the very probable reason of his own machine being easily managed in traffic. A Moto-Rêve would also be surprisingly manageable in traffic if it were fitted with a gear proportionately below the normal! It is hardly necessary to comment upon the jockey pulley, as everyone knows that our machines are now V belt direct driven.

We differ from your contributor in that we claim that there really exists a serviceable and comfortable lightweight touring machine.

THE MOTO-REVE CO.

Belt v. Chain and Two-speed Gears.

[3359.]—We have read with pleasure Dr. Patterson's recent letter on the subject of belt *v.* chain and two-speed gears.

The superiority of the belt transmission is conceded by nearly all motor bicycle makers. Contrary to your correspondent's supposition, they do not turn a deaf ear to the needs of professional users.

In respect to motor bicycle design as we find it to-day, the dictionary appellation of "bicycle" as applied to an autobicycle, seems to have lost much of its primitive meaning. There are still advocates for a lightweight motor bicycle with pedals, who are not yet alive to the appreciation of that comfort and convenience which the equipment of the modern touring machine provides.

There are now two categories of motor bicycles—(1) the lightweight, requiring pedals; and (2) the average weight minus pedals, and requiring power, stability of construction, and such more or less indispensable conveniences as a clutch with a variable gear. Dr. Patterson states that the Roc, for instance, does not allow of the use of pedals—"an absolute necessity in case of breakdown for a medical man." Might one not with equal relevance reply that the owner of a 40 h.p. car is not provided with shafts for horse traction in case of emergency or breakdown? If the analogy is exaggerated, yet Dr. Patterson and others must see that the physical exertion sufficient to propel a modern motor bicycle weighing 170 lbs. (the weight your correspondent mentions with pedals) over any distance in excess of a few yards seems to make the preservation of pedals unnecessary, and quite useless for any practical object.

In regard to two ignitions, the reliability of the magneto seems to make supplementary ignition also unnecessary; it means added complication and added cost, but, of course, there is no disadvantage.

Most motor bicycle users are clamouring for easy starting, the solution of which is provided by starting from a live back axle with engine geared up on to the back wheel. In this form a machine starts no more easily with accumulator than with magneto ignition.

A. W. WALL, LTD.

Air-cooled Cylinders.

[3360.]—*Re* letter 3343, I rode a 4 h.p. Jap engine with the cylinder, valves, etc., completely cased in a copper jacket, and with a fan pumping air past the engine. It ran very much better in this way than with the jacket off and a twin fan on each side. HAROLD M. WOOD.

Belt Fasteners.

[3361.]—Will you kindly allow me to add my grumble to that of "Ixion" in reference to the above? No matter how perfect a machine may be in other respects, such a trifling detail as a poor belt fastener makes all the difference in the world between pleasure and (to say the least) misery.

If all motor cyclists have had the same experience as I have had with poor and defective fasteners, they have my deepest sympathy. Why cannot manufacturers of these articles make a good substantial article, and one that can be recommended? and, in addition to "Ixion's" suggestions, I would also suggest that the underside of the fastener should have a hole the same size as the shank of the screw, and *well* threaded. Also that the screw should be the same thickness from end to end, and not to taper, as it does at present.

Look at the miserable microscopical hole on the underside and the paltry thread on the screw, and to think they are British made by British labour. If the ordinary motor cyclist has bought as many of these as I have, then the makers are simply coining money, and one cannot wonder at it.

Perhaps someone interested will take this matter up and place a good, reliable fastener on the market. It would meet with a grand success. O 693.

Sidecars.

[3362.]—Will you allow me to make a few remarks on the letter which you published in your last issue over the signature of B. Richardson Billings, M.R.C.S., L.R.C.P.?

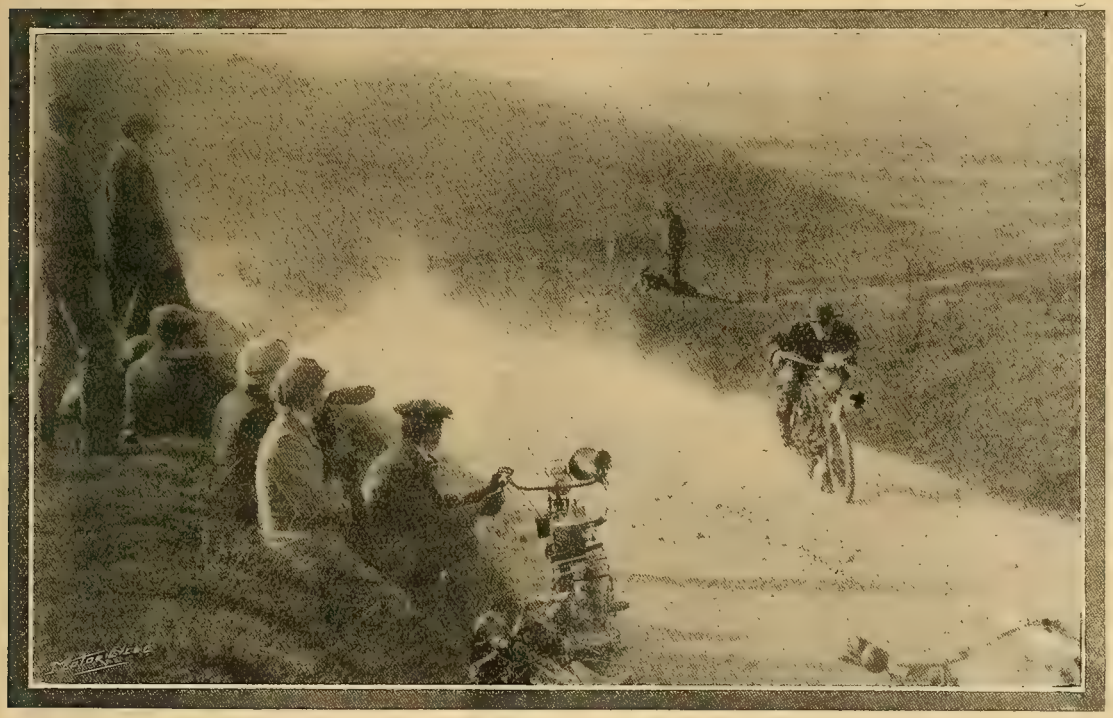
Mr. Billings infers that the letters on sidecars which you have been good enough to publish from the members of the trade, and other letters which you may publish in the future, are "chiefly disguised free advertisements from those monetarily interested." For my part I protest against this inference being put upon any communication I have addressed to you in these columns, and I can only describe the suggestions as a "little mean."

Mr. Billings is not a mechanic but an enthusiastic amateur, and most of us know to what lengths this condition will lead a man. Mr. Billings is a doctor, and if I were to write saying I had an infallible cure for headache, I can imagine Mr. Billings saying something about "quack"; and if I were to go further and say, "Take no notice of the doctor; it is to his monetary advantage to keep you in pain for a considerable time," Mr. Billings would probably be indignant.

Mr. Billings and I have differed on the question of the best mechanical construction of the sidecar. I take my stand on the fact that I served seven years apprenticeship in one of the most exact and best-equipped works in this country; furthermore, I have been engaged in mechanical construction for over twenty years. For the last six years I have devoted most of my time to the sidecar, and I think I can claim to have as much experience with sidecars as any man; also, I am open to prove my points at any time.

I think most of your readers will accept this as reasonable ground for my stating an opinion on a subject to which I have devoted so much attention, even though I am "monetarily interested," and will give me credit for some sincerity when I differ from the theories of an enthusiastic amateur who devotes *some* of his spare time to the subject.

W. MONTGOMERY.



Lieut. Tracy, R.N., winning the multi cylinder class in the Naval M.C. hill-climb, on his four-cylinder F.N. In addition to making fastest time, he was placed first on formula.

Practical Touring Machines.

[3363.]—It would be very interesting to Scottish motor cyclists if some of our English friends on their road south after the End-to-end, would make a detour and try to ascend Cairn-o'-Mount from Fettercairn to Banchory. On a recent club run of the Perth and District M.C.C. the only machine to ascend under its own power and carrying rider was a Phelon and Moore two-speeder, which took it without any difficulty. I may mention that the surface is a mass of loose stones, and the worst grade and surface are both at bends. ES 186.

A Problem to be Solved.

[3364.]—I read with very great pleasure every word in *The Motor Cycle*. I feel at a loss when for any reason a single number is miscarried. I wish we had a paper in America that was equal to yours in the motor cycle field.

As an engineer, I have been much interested in your articles on "Why does an air-cooled engine overheat?" I should like to give your readers a problem, and have the matter discussed in your paper. I have come across a peculiar phenomenon which I am not able to explain to my entire satisfaction.

All of your readers are no doubt aware of the fact that the F.N. Big Four, as we call the four-cylinder machine in this country, has a 6 to 1 gear, and it cannot be expected, therefore, that a machine of this gear will develop a very high speed. However, at times I have beaten high-powered and high geared twins on the level, and for distances of about one or two miles. This is how I have accomplished it.

After a Big Four has been run for two or three thousand miles, and if it has been carefully lubricated in that time, the pistons become like glass, and the internal friction of the engine and transmission is reduced to a minimum. It is remarkable how freely the engine moves. If now an engine be taken in this condition and run with full throttle and full air with advanced spark for some time, it becomes very hot as a matter of course. I have found on several occasions that if I oil very excessively and race the engine, suddenly something takes place, and I dart ahead at an abnormal speed. I never obtain anywhere near this speed when the engine is running in a normal condition. Let me describe an actual occurrence.

One day I was coming home after a run, and I passed a high-powered twin. We were going at about twenty-five miles an hour, and as soon as I passed the twin the rider of it opened up his throttle and I could hear him coming up rapidly behind me. He passed me, and just as he did so I opened up my own throttle and set the air and spark to get maximum speed. We came to a slight down grade, and both of us kept full throttle down this grade. Now that was exactly what I was wishing for, as I find that this abnormal speed is easily obtained if I race the machine down a slight grade. The twin drew ahead of me, there being a difference between the speed of the machines of about five or seven miles per hour. Suddenly the note of my machine increased, that is the musical note emitted by the rapidly exploding engine, and I found that my engine was in the abnormal state above mentioned. The way I went after that twin surprised him exceedingly, and I passed him at fully as fast a speed as he had passed me a moment before. I may say that I have only obtained this abnormal condition about six or eight times since I have ridden the F.N., that is during the last two years.

At first I thought that I had a case of pre-ignition, and that the inside of my cylinders being coated with carbon had become more or less incandescent, that is, that projecting pieces of carbon had become incandescent, and that the explosion of the gas took place almost instantaneously. I found, however, that pre-ignition was not the cause of this abnormal state, since when I cut off the spark on one of these occasions the machine stopped firing instantly. I have given the matter quite a little thought, and I have the following explanation to account for this phenomenon.

In the first place, I only obtain this abnormal condition of the engine when I oil abundantly. As a matter of fact, I oil about every two miles. Furthermore, it is almost impossible for me to obtain this condition on the level, but I can get it with an old machine very much easier by running down a slight grade. It seems that the engine must come up to a certain speed before this abnormal condition takes place. My explanation of this is, when the engine becomes very hot the pistons expand and almost come in contact with the cylinders. As I am lubricating very freely the oil forms a continuous film between the pistons and the cylinders, and the compression is not dependent on the piston rings. In other words, at these times I have perfect compression, the oil itself preventing a leakage past the piston. I tried to account for this on the explanation of synchronous vibration. I thought that perhaps at first nodes and loops were formed in the exhaust pipe of the engine in such a manner that a node occurred at one point of the exhaust pipe and a loop at the other, so that I had the same effect as a condenser on an ordinary steam engine, that is, my engine was exhausting into a space at less than atmospheric pressure. However, I believe the explanation as given above is more plausible.

This seems to be a very interesting phenomenon, and I should like to see the matter discussed in your magazine. Possibly some of the European riders of the F.N. Big Four have obtained this peculiar state in their engines, and can give your readers their experience. I have never heard of a large engine working in this manner, and think that perhaps this is due to the fact that an engine of greater capacity would not stand up under this enormous strain and heating. I should like your correspondent who has stated that an air-cooled engine overheats to explain why it is that I get this abnormal power only when my engine is at the maximum temperature. As a matter of fact, I am of the opinion myself that an air-cooled engine does overheat, but I cannot reconcile this opinion with the above phenomenon.

Start of the final Three Miles Race at the Tunbridge Wells Sports on Whit Monday, won by C. E. Bennett in 4 min. 56 sec.

I shall close this letter with the remark that the 1908½ model is a great improvement. I have just been up to our famous Fort George Hill, and the way that it takes my 200 pounds up that hill is surprising.

Hoping that you will not think that because I am an American rider the enclosed letter will not be of enough interest to your readers to warrant publication, and wishing your magazine the best of success, I remain,

New York. EARLE L. OVINGTON.

[Does the extra lubricating oil participate in combustion and propulsion at very high temperatures?—ED.]

EXPERIENCES WANTED.

"H. N." (Malta) is anxious to have readers' experiences of the following machines: The 5 h.p. Phänomen, the Moto-Rêve, and the 4½ h.p. four-cylinder F.N., and, as regards the latter, particulars regarding wear of the working parts, running expenses, etc.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

MOTOR BICYCLES FOR SALE.

2½-3 h.p. Fairy, condition as new; £16. — Tyler, Earl's Colne, Essex.

2 h.p. Minerva, M.V.; £7.—G.H., 116, Longley Road, Tooting Junction, S.W.

REX, 3½ h.p., 1904, splendid condition; £10, bargain.—45, Chalvey Road, Slough.

£8.—Lightweight, 2 h.p., B.S.A. frame, magneto, Clinchers.—10, City Road, E.C.

3½ h.p. M.M.C.; bargain, £12; footboards.—Leach, 8, Foxley Road N., Brixton.

3 h.p. Fafnir, as new, accessories, perfect; £16, exchange.—48, Sydney Road, Hornsey.

LIGHTWEIGHT, 2¾ h.p. Clarendon, 90 lbs.; £12, exchange bike.—137, Dalston Lane, London.

3 h.p. Triumph, magneto, spring forks, new tyre and belt; £24. — Cross, Jeweller, Rotherham.

TRIUMPH-MINERVA, 2 h.p., running order; £8.—21, York House, Highbury Crescent, Highbury.

ARIEL-MINERVA, 2¾ h.p., good condition; £14 10s.—George, 11, Liverpool Road, Islington, N.

3 h.p. Quadrant, in good condition, guaranteed, good hill-climber; £10.—Wenmoth, Launceston.

£12, or Offer.—3 h.p. Fafnir, Chater, Palmers.—Seen, 5, Denmark Street, Charing Cross Road, W.C.

CHATER-LEA, De Dion, 2¾ h.p., low, long bars, new tyres; £14.—77, Crescent Lane, Clapham Park.

1907 3½ h.p. Brown, magneto ignition; £20; seen any time.—Hall, 61, Parsons Green Lane, Fulham.

FAIRY Lightweight, two cylinders, perfect condition; £16; approval willingly.—Birt Morris, Bourne.

3½ h.p. Kerry, good condition, long handles, spring seat, spares; £15.—Watson, 23, East Hill, Ashford, Kent.

3½ h.p. Kerry, Clinchers, Longuemare, good condition; £12, bargain.—Horncastle, outfitter, Grays.

3½ h.p. Fafnir, Chater-Lea frame, Osborne free engine; £14.—Mason, 38, Victoria Road, Stroud Green, N.

3½ h.p. Jap, M.O.V., overhead, latest low model by Jap throughout; £22 10s.—48, Pentney Road, Balham.

FOUR-CYLINDER F.N., 4½ h.p., latest, practically new, perfect order; £32.—Sembill, jeweller, Finchley, N.

3 h.p. Motor Bike, Fafnir engine, in good condition; £15 10s. — Rossiter, South Road, Kingswood, Bristol.

ROC, 3 h.p., magneto, free engine, good order; £18 10s.—28, Grosvenor Road, Handsworth, Birmingham.

2½ h.p. Bradbury, perfect running order; £9 10s.—Holzapfel, 4, Summerhill Grove, Newcastle-on-Tyne.

2¾ h.p. Bat, De Dion engine, in splendid running order; £14.—142, Lewisham High Road, New Cross, S.E.

FOR Sale, 3½ h.p. 1905 Rex, little used, splendid climber, just overhauled; trial; £13.—Lloyd, draper, Corwen.

2¼ h.p. Bradbury, perfect condition; trial; 10 guineas; wanted, higher power. — Mickleburgh, draper, March.

3½ h.p. Motor Cycle, excellent condition, good hill-climber; £12.—Grahame, 97, Wimpole Street, London, W.

TRIUMPH, late 1907, 3½ h.p., magneto, hardly ridden; £32.—Apply, Cedric Boustead, Westfield, Wimbledon.

BAT, 2¾ h.p. De Dion engine and carburetter, splendid condition; £15.—M., High Stone Garage, Leytonstone.

2 h.p. Brown, perfect order, just overhauled, spring seat-pillar, carrier; £10. —McLennan, Castlehead, Paisley.

4¼ h.p. Bat, Stevens engine, spring frame, long handles, excellent condition, very fast, not done 800; £25.—Foreman, Halesworth.

TRIUMPH Lightweight, 1½ h.p., Longuemare carburetter, Clincher tyres, B100 saddle, in good order throughout; £7 10s.—Bunting, Wealdstone.

6 h.p. Twin Rex £18 18s.

or £4 and '07 single Rex, £6 and '06 Rex. Liberal allowances for other makes.

TWIN-CYLINDER MACHINES.

6	h.p. TWIN REX, black finish	£19 19
6	h.p. TWIN REX (1907), magneto	25 0
5½	h.p. REX DE LUXE, Roc clutch, magneto, twin tyres	27 10
5½	h.p. REX DE LUXE, shop-soiled, Roc clutch, magneto, black finish	25 0
4	h.p. TWIN N.S.U., magneto, two speeds	23 10
6	h.p. TWIN N.S.U., magneto, 2½in. tyres	23 10
5½	h.p. TWIN VINDEC, magneto	20 10
4½	h.p. TWIN MINERVA, 2½in. tyres	23 10
3½	h.p. TWIN WERNER, spring forks, light	13 13

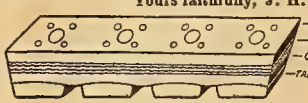
MOTOR RUNS FASTER.

40, Jubilee Road, Doncaster, May 12th, 1908.

Dear Sir,—I am very pleased to inform you that the sample Centipede ¾in. belt you sent me gives every satisfaction. It is the best belt I ever used, and I'm no chicken in motor matters. It "grips" and is beautifully clean, practically free from stretch, very flexible, and my machine runs faster with it than ever before. Trusting you may have the success you deserve,

Yours faithfully, J. H. Wilkinson.



Price of Belt per foot:

"YOU DON'T BELIEVE US"

when we tell you our **"GLARE LAMP"** for Motor Cycles, etc., only uses ½-amp., and will run off your ignition cell, and yet **GIVE MORE LIGHT** than an Acetylene. Read what the famous Cyclist has to say about it:

"Messrs. J. W. Greenwood, Ltd.,
Portland Place Works, Halifax.

"Dear Sirs,—Some little time ago you supplied me with a Glare Motor Cycle Lamp. I am pleased to inform you that this has given every satisfaction, and has fulfilled all you state in your circular. I get a splendid light from it, and when correctly adjusted it is indeed an improvement on anything I have used previously. Your Patent Regulator is most useful, and when correctly adjusted the beam of light that can be obtained is very powerful. It uses a remarkably small quantity of electric current. I have already recommended this lamp to several of my friends, and feel sure before very long you will be having some good orders from this district. I have also found the lamp bracket simple and useful. Wishing you success with this valuable little line, I remain, yours faithfully, LUTHER MYERS, Bradford."

We are confident you will use no other kind when you have once tried one of these. Money refunded if not what we claim.

You will be well advised to have one or more of our **ADJUSTABLE LAMP BRACKETS** fitted, if you intend carrying Acetylene Lamps. Everything we sell we guarantee satisfaction. Have you one of our **ORIGINAL VARIABLE SPEED PULLEYS?**

J. W. GREENWOOD, Ltd., Portland Place Works,
HALIFAX.

FARRAR.—Tyres, fully guaranteed; 26 by 2, 16s.; 26 by 2¼, 17s. 6d.; 28 by 2, 16s. 6d.; 24in. same price.

FARRAR.—Tremendous stock Continental tyres; your old tyre accepted in exchange; list free.—Farrar, Square Road, Halifax.

CLINCHER A Won Brand New Covers, 26 by 2, 19s. 6d.; 26 by 2¼, 21s.; also extra heavy 26 by 2 ditto, 21s.; order at once; only a limited quantity; prices are below usual trade prices; approval.—Lomax Tyre Co., Great Charles Street, Birmingham.

MAUDE'S.—Fully guaranteed tubes, 26 by 2in., 6s.; 2¼in., 7s.; 2½in., 8s.; 28 by 2, 7s.; 2¼, 7s. 6d.; 2½in., 8s.; approval willingly.

MAUDE'S.—Covers, 26 by 2in., 16s.; 2¼, 17s. 6d.; 28 by 2in., 17s.; 2¼in., 18s.—Maude's, Powell Street, Halifax.

HALIFAX.—Brand new inner tubes, best make, 26 by 2, 6s. 6d.; 26 by 2¼, 7s.; 28 by 2, 7s.; 28 by 2¼, 7s. 6d.; 28 by 2½, 8s. 6d.; genuine Calmon covers, with non-slipping tread, 26 by 2¼, 15s. 9d.; 28 by 2, 15s. 9d.; 28 by 2¼, 16s. 9d.; 28 by 2½, 20s. 6d.; all beaded edge. —Halifax Motor Exchange, Westgate, Halifax.

REPAIRERS.

IRIDIUM Champion "Indestructible" Contacts; any part fitted, returned same day; 3d. each.

IRIDIUM Champion "Indestructible" Contacts; warranted pure; special trimmers for polishing iridium, 9d.; no filing required.

IRIDIUM Champion "Indestructible" Contacts; hundreds in use.—Williams, 16, Wellington Street, Woolwich.

£5 any motor cycle we cannot repair. — Whites, 22, Brookes Street, Church Street, Liverpool.

LIVERPOOL.—£5 any motor cycle we cannot repair.—Whites, 22, Brooks Alley, Church Street.

REPAIRS and Replacements of every description to motor cycles.—Campbell, 156, Wirtemberg Street, Clapham.

GRIFFIN and Sleat, Eastbourne.—Cylinders re-bored and new pistons fitted, or engine completely overhauled; let us quote you.

RELIABLE Repairs.—Complete pistons from 6s.; re-boring, new pistons, from 12s. 6d.—Gas Engine and Motor Works, Forest Hill, S.E.

PAIR Brass Side Lamps, 10s.; aluminium enclosed fan, 7s. 6d.; Micrometer motor free-wheel, 4s. 6d. — A., 8, Herndon Road, Wandsworth.

LEICESTER and County riders should look up the Central Motor Co., Langton Street, Belgrave Gate, Leicester, for repairs, tyres, accessories, and accumulator charging.

CCCCCCCCC Compression means power. — Cylinders re-bored and new pistons fitted; guaranteed fit 4-1,000in.; bears 13 stone on pedal; write for list.—Gradior Machine Co., Compression Specialists, Stafford.

Riding Position.

POSITION is everything. So reads a well worn phrase, but not too threadbare, we hope, to allow us to quote it once in connection with motor cycles and their riders. Motor cyclists can assume a position that is graceful or hideous, according to the design of the machine they ride and their own inclinations. First a motor cycle saddle is, or should be, near to the ground in comparison with a pedal cycle saddle. This causes the rider's knees to be tucked up into his chin if he is foolish enough to ride a machine that is not provided with footrests, so the moral is to have footrests, and have them sufficiently far away from the seat to enable the legs to be comfortably extended without causing them to be stretched. Some riders say, "Pedals for me, no footrests. I can stand on one or both of the former when passing over a bad road, use my knee flexion as a spring, and therefore require no spring frame." This is true enough, but why not the footrests for comfort and the pedals for bad roads? One does not always ride on apologies for macadam. Having settled the footrest position, the next thing is the handle-bar position. A motor cyclist does not require a crouching position, therefore the handles must be upturned. The rider requires to sit some inches behind a vertical line drawn through the pedal crank axle bracket, so that the handles must be brought well back, but the bars must not be level with the horizontally extended thighs when pedalling, or the machine would be difficult to turn sharply. To overcome this objection the handles should be bent upwards to enable the two ends to swing over the tops of the thighs, and yet not too long so that they dig into one's ribs if a sudden turn is necessary. A few machines are ideal as regards a comfortable riding position when handle-bar and saddle are once adjusted to suit the rider, but there remain quantities that could be vastly improved in this direction, both new and old. When every maker of a motor cycle is a long distance rider—not a rider who takes the machine out for half a mile on wood pavement to see if the engine fires all right—these and similarly simple matters of design will be quickly righted.

"Popping."

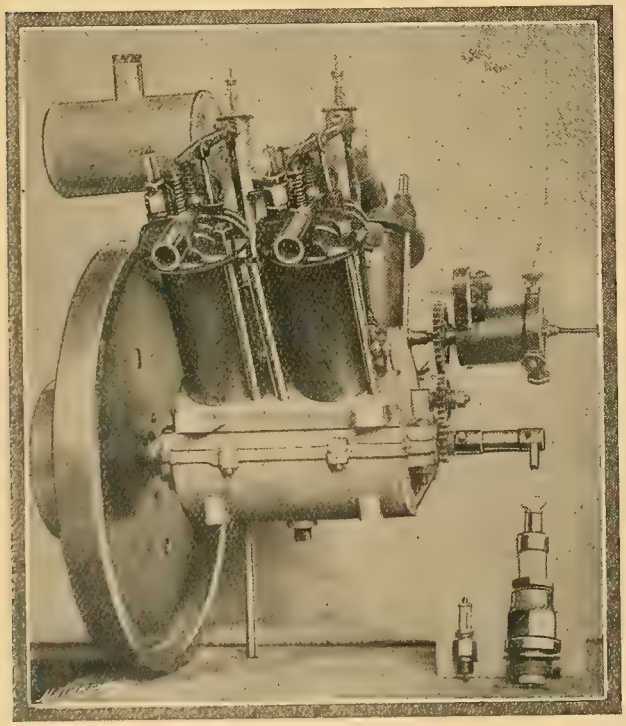
WE should like to ask motor cyclists who have engines addicted to "popping," or exploding in the silencer, if they have ever asked themselves what is the cause of this most objectionable feature. All engines will do it, some makes noticeably more frequently than others, and the nuisance is not confined to motor cycle engines. We know of a particular make of car engine that will "pop" in the silencer the moment the accelerator pedal is released, which action on a motor cycle is equivalent to closing the throttle. This engine has a so-called automatic carburetter, and when the throttle is closed the air is not cut off in proportion, and the mixture being too weak to fire regularly every fourth stroke, every other charge is pumped into the silencer and there ignited by the succeeding burning gases which enter the silencer in the form of a hot flame that would set fire to anything short of asbestos.

This is one cause of "popping." Another is one which cannot happen unless the engine is provided with an exhaust valve lifter. In the second case the lifter is raised, gas is travelling along the induction pipe, and its flow does not positively stop immediately the valve is raised; consequently the next few induction

strokes draw in a small amount of gas which is pumped into the silencer, and if the valve is dropped before this unburnt gas has time to become completely expelled from the silencer, the next explosion sets fire to it, and there is a horrible "pop" in the silencer. Now, from experience we have gained with practically every well-known make of motor cycle, in some cases it is possible to prevent it. On one or two makes it practically never occurs unless the rider is driving with too rich a mixture, or an imperfect mixture; on others it is next to impossible to prevent it. Cool or hot, some engines will explode in the silencer, and it is time the actual cause or causes were generally known and corrected. It is a fact that on an otherwise perfect engine it is possible for "popping" to take place and for the cause not to be known with absolute certainty. It is possible to take an engine and make it "pop" and then adjust it so that it does not do it, but that is not our point. We want to see it prevented on every engine, as it does not invariably arise from faulty manipulation. Experienced drivers of both motor cycles and cars have told us that they have not always known what was causing explosions in the silencer, or they would have been only too pleased to remedy matters. Motor cycle engines are worst in this respect, because they are almost without exception controlled by a valve lifter, and nothing is more calculated to give a bad impression than to see a motor cyclist passing through a crowded street with the engine giving out frightful bangs every few yards. The public think that such methods of propulsion—or should we say retardation?—are the usual accompaniments of the motor cyclist on tour, much as they thought vibration was ever present because they saw a motor cycle bounding from one rock to the other of their badly macadamised suburban roads, forgetting that their daily milk is nearly churned into butter by the same process, and that smoother surfaces do exist even if they have never seen or ridden on them. This "popping" must be overcome, and as difficulties exist only to be won over, we trust makers will at once turn their attention to preventing it.

A Miniature Four-cylinder Engine.

WE have received a photograph of a most ingenious little four-cylinder engine of the V type, the work of a garage mechanic in the North London district. It is air-cooled, and develops about 1.25 h.p. at 1,300 revolutions per minute. Some idea of the size of the engine can be gathered when we say that the cylinders of the motor were made from 1¼in. steel tubing, and its total weight, as per illustration, only 8 lbs.! The owner, Mr. D. Stanger, 6, Hale Road, Tottenham, cast and machined the parts himself, or got them done to his drawings. He claims it to be the smallest working air-cooled petrol engine in the world, and we ourselves do not think any of our many thousand readers will be able to go one better. The engine under notice is being used for experimental aeroplane work, and has been found to drive a 2ft. propeller (2ft. pitch) quite easily. The ignition is very ingenious; the maker had to construct his own contact-breaker, sparking plugs, distributer, and single coil. The size of a normal sparking plug by the side of one of the specially made plugs for the engine gives an idea of its midget proportions. It is without doubt a very interesting example of painstaking and thorough workmanship.



A four-cylinder engine weighing complete only 8 lbs.

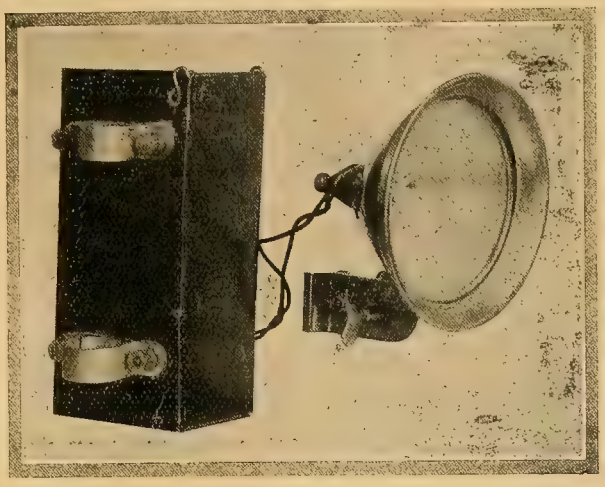
We are indebted to Mr. B. Richardson Billings, a previous contributor to these pages, for bringing this engine to our notice.

In order to meet the increasing requirements of West End patrons, Messrs. Harvey Frost and Co., Ltd., have considerably extended their premises at 27, Charing Cross Road, where a big stock of H.F. vulcanising materials and tools, and also H.F. vulcanisers, is now installed. Every requirement, therefore, can now be promptly met at the firm's West End address. Any reader desiring a free demonstration on an H.F. appliance can easily obtain same by calling, or through the medium of an introduction card obtainable at most motor depots in London and the provinces.

We have received from Maude's Motor Mart, Powell Street, Halifax, a spare air tube carrier in the shape of a round metal box. Provided the air tube fits the case tightly, it should be a very good means of carrying a spare tube, but if it is at all loose in the box some protection should be provided in the form of a flannel or baize lining, otherwise vibration will cause the edges of the air tube to be chafed until the tube is spoiled. It is a common mistake to carry an air tube on tour without careful packing, and to find at the end of five hundred miles riding that the edges are chafed through and the tube rendered useless. In future, acting on a suggestion we have made, these carriers will be lined with soft baize without extra charge. The tube should also be well coated with French chalk.

THE GLARE HEAD LAMP.

WE have recently been trying one of the small Glare electric head lamps with four-volt accumulator in metal box. This lamp is made and sold by J. W. Greenwood, Ltd., Portland Place Works, Halifax. The metal battery box is provided with clips to attach it to the seat tube of a motor cycle or to any other convenient tube where it can be carried in an upright position. The interior of the box is lined with indiarubber sheeting, and the accumulator supplied fits it perfectly. We find that the lamp gives considerably more light than one would expect from a small four-volt bulb, and it is a handy lamp to have on a machine when a light is required at frequent intervals for a short run. For instance, medical men find these lamps useful, as the light can be switched on immediately when it is necessary to answer an urgent call. We found that the strength of the light depended on the way in which the bulb was adjusted in the lamp, and as the Glare has a means of adjusting the bulb nearer to and further from the reflector, one can so adjust the position that the very best light is obtained. In the case of accumulator ignited engines, the bulb can, of course, be lighted from the ignition battery, but the special battery and case are essential in the case of motor cycles equipped with a magneto.



SIDECARS AND 3½ h.p. MACHINES.

THERE seems to be a good deal of misconception as to what a good 3½ h.p. motor bicycle will and will not do when attached to a sidecar. Some riders say a motor bicycle minus a two-speed gear is useless with a passenger attachment. This statement, of course, is far too sweeping, for many motor cyclists will recall pleasant trips two or three years ago with sidecars on 3 h.p. bicycles, which were at that time most common. With the primary object of making experiments for the benefit of our readers, we obtained a Montgomery flexible sidecar attachment some weeks ago, and fitted it to a 3½ h.p. motor bicycle in our possession. We may say at once that our experiences have been entirely satisfactory up to the present, after having covered several hundred miles. One reason why the Montgomery sidecar appealed to us was on account of its instant detachability—a great point, as in our case as much riding is done alone as with a passenger. With only a 3½ h.p. engine, naturally there is little or no reserve of power on hills, but with a combined weight of 19 stones and a gear of 5 to 1 we can cover long stretches without the slightest hitch, and climb all ordinary hills—say, up to 1 in 15—and rush short hills of about 1 in 9 or 10 without using the pedals. When considering the question of fitting a sidecar attachment, the questions resolve themselves to the following:

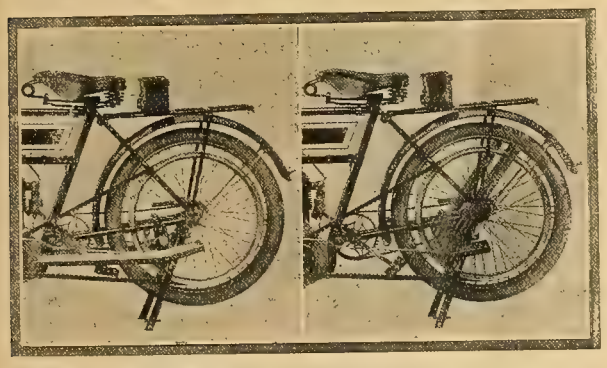
(1.) Is the district to be ridden in most a very hilly one?

(2.) Do the driver's and passenger's combined weights exceed 20 stones?

(3.) Is the 3½ h.p. of the bicycle to be used over-rated by the makers?

If all the above questions can be answered in the negative, we can assure our readers the purchase of a sidecar will be a distinct success, as quite long distances can be covered without any physical exertion whatsoever. Judicious driving, however, is necessary at all times to keep the engine from overheating when a severe rise is encountered, and the oil pump should never be forgotten! The greatest strain is naturally on the transmission and the back cover, so spares of each should be carried on a tour. The bicycle we are using with the Montgomery sidecar is a 3½ h.p. 84 mm. × 86 mm. Triumph, and we have still to record our first involuntary stop from any cause whatever. The steering is not at all difficult; almost any cyclist can steer the combination at the first attempt, there being only a slight pull on whichever side the attachment is fixed.

It is almost superfluous to add that a reliable change speed gear would be a boon, but it is not an absolutely indispensable fitment. Two years ago the writer used a Montgomery sidecar, while last year he owned a tricar, and on returning to the sidecar again he is convinced that for comfort, sociability, reliability, handiness, ease of storing, and low cost of running it will take a lot of beating. It may be mentioned that the average consumption in a fairly level district is in the neighbourhood of eighty miles to the gallon.



Folding footboards supplied by the Premier Motor Co., Ltd., to Mr. J. Leno, son of the late Dan Leno. When it is desired to use the pedals, the footboards can be set up out of the way.

A TRIAL OF A TWIN REX.

By B. H. DAVIES.

"TRIAL" is a word of ever-changing meaning to the motor cyclist. Time was when it meant to me a cautious gambol round Hyde Park previous to a rash purchase. Then the hill-climbing bugbear loomed larger, and I felt no trial was complete that did not include the ascent of Westerham. Then racing theory infected me, and my trials took the form of an early morning run at double legal limit, and as prolonged as might be. Then, again, I learnt with some machines to use the word trial in a purely scriptural sense; it *is* a very real trial to travel even a few miles on some machines. But to-day, when practically every machine is speedy, a good hill-climber and reliable, "trial" has been narrowed down in meaning till for me it scarcely includes more than tests of comfort, control, and especially FLEXIBILITY (capitals, please), the old trio of desiderata—reliability, speed, and hill-climbing—being taken for granted.

It Rose Nobly to the Occasion.

However, the other day, when Mr. Williamson put a 5 h.p. Rex Tourist at my disposal, circumstances allowed very complete tests to be made, covering some 250 miles. The machine was the special hill-climbing model, with ball bearing engine, but minus the Rex cantilever seat and the free engine. I trusted myself to the machine in the most childlike fashion, taking it out with no stand, no pump, no repair outfit, no tool kit, no spare sparking plug—in fact, in approved mechanic fashion, with no other outfit than a small King Dick spanner and a screwdriver—and it rose nobly to the occasion, covering the distance with one involuntary stop, due to the stripping of a nut on the saddle clip. Thus the machine proved its reliability. Its illuminated certificate did not err on the side of generosity, for it only certified forty miles an hour, and it would do that comfortably with the throttle only a quarter open, while with a more liberal supply of gas it would romp up all grades up to one in ten without the faintest diminution of speed. Thus the machine proved its speed and hill-climbing powers; in fact, one of my tests was a forty mile spin at a secluded hour, to test it for overheating, and except at corners it was given its head the whole way, plus a charge of Wilburine every five miles, and it finished almost as cool as the proverbial cucumber. This left me with comfort, control, and flexibility to test the machine for. The comfort was frankly disappointing, as the springs of the front fork were decidedly too stiff for my weight, and, in addition, when Nature designed my legs, she had not foreseen that I should ever ride a 20in. frame. I felt in momentary danger of being forced out over the back mudguard by the heavy wind pressure whenever I let the machine out; however, it is well understood that this is the speed merchant's Rex. He who would potter in comfort is meant to ride the heavier mount with the cantilever seat.

A Perfect Control.

The control was admirable. Belt rim brakes destroy the necessity for a second brake, and so it never occurred to me to try the hand brake at all. The levers were all delicate in adjustment, easy to handle, and as firm as St. Michael's Mount or the Eddystone, when they were set at any point. Steering with my left hand almost exclusively, I found it awkward to have both devices for stopping the engine on the right grip, so I soon transferred the switch—a most cosy and ingenious little fitment—to the left grip, and the control was then ideal.

But it was in my third desideratum of flexibility that I was most delighted with the machine. Other machines have ball bearings to the mainshaft; the Rex has ball bearings to the connecting rods, and as a consequence I am fain to admit I never drove an engine that would pick up with such smooth celerity. Time and again I slowed right down to the balancing point to thread my way through a drove of cows, until the front wheel had to be waggled violently right and left to maintain any equilibrium. A hasty reach forward to the spark advance, a lightning dab at the throttle lever, and anon a more leisurely opening of the extra air, and the rear wheel was felt positively snatching at the roadway beneath one, until in a hundred yards or so it was roaring on at a smooth forty, and albeit taking it so quietly that the pace would never be realised but for the telltale watch on the bar and the frequent milestones bobbing up, curtseying, and vanishing aft. This facility of picking up led me to make some cruel tests on a hill. I first of all ran it as hot as I could—which was not very sultry, when all is said and done. Then I charged a long hill at full steam, and gradually slowed down to a crawl on a stiffish knuckle, until the road speed was too slow for the maximum retard of the ignition, and signs of approaching knock were discernible. Then the throttle was slashed open, the spark ruthlessly dashed forward, and the engine gathered furious pace with a calm, masterful rush, devoid of jerk. The unfortunate wheel and tyre were unequal to its snatch, and I felt the wheel leap and hammer beneath me, but the smooth acceleration of the engine was resistless, and ere the crown of the ascent was reached the machine was tearing up like a Great Western express.

I returned the machine with strong envy of the lucky owner who was to receive delivery of it that week.

"Ixion" sends us the annexed photograph, which has been sent him by a correspondent who prefers to remain anonymous. He says: "The photograph is of my brother's 3 h.p. Fafnir cylinder. He was riding it in town the other day, when it stopped with a crash. On dismounting and looking at his engine he saw the hole as shown. At night we took it to pieces, and found connecting rod doubled up and half the piston broken in small pieces, but the top half above the gudgeon pin with the three rings on in good condition. The gudgeon pin had gone clean through the cylinder, and not cracked it at all. **He had no** set screws in the piston, as he took them out last year. I forgot to mention he looked all round for the piece of cylinder or gudgeon pin, but he never found it."

MOTOR CYCLING IN INDIA.

A VERY pleasant motor cycle gymkhana was held under the auspices of the Deccan Motor C.C., Poona, India. The run was to Katrag, eleven miles out of Poona, and the following riders entered for the run and the hill-climb, extending over two miles:

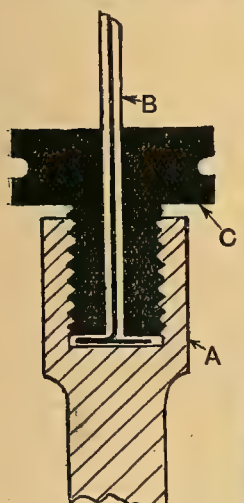
W. Janet (4½ h.p. Minerva), Capt. Cotter (2¾ h.p. Quadrant), Lieut. Barker (3½ h.p. Riley), Pat Stewart (3½ h.p. Triumph), E. Duckett (4½ h.p. F.N.), R. Mody (2¾ h.p. Hobart), Sirdar Blingwantra (2½ h.p. Triumph), W. Gillard (3½ h.p. Triumph), and H. Ruston (3 h.p. Peugeot).

The run was most successful. As a result of the handicap the result worked out as follows: 1, W. Janet (4½ h.p. Minerva), 40s. start; 2, R. Mody (2¾ h.p. Hobart), 155s. start.

Motor cycling is increasing in popularity in India, writes our Poona correspondent. The riders depicted above competed in a most successful gymkhana at Poona last month.

A NON-CORROSIVE ACCUMULATOR TERMINAL.

AN exceedingly neat form of terminal has been placed on the market by the Non-corrosive Terminal Co., 13, Grape Street, Oxford Street, W. Referring to the line illustration, which is a section, it will be seen that the terminal consists of a hard lead cup A, a portion of which is threaded to receive the celluloid stopper C, through which the insulating conductor B passes. The end of the wire B is burred over, and when the stopper is screwed up it makes a firm contact against the bottom of the cup. The end of the cup makes contact with the lug connecting up the plates. The accompanying photograph shows the terminals fitted to a Peto and Radford accumulator. It is obvious that no acid can reach the naked portion of the wire, so that the title non-corrosive is one to which the device has an incontestable right.



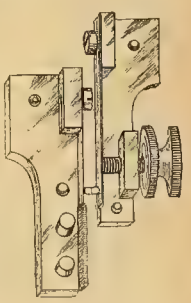
Vertical section of lead and celluloid terminal.

A. Hard lead cup.
B. Insulated wire from coil.
C. Celluloid stopper which holds the splayed ends of the conducting wires against the floor of the cup.

The Non-corrosive Terminals fitted to a Peto and Radford Accumulator.

A NEW TYPE OF TREMBLER.

ON the trembler which forms the subject of the annexed sketch the usual vertical position has been changed to a horizontal one. The two projecting pieces on the left, being in connection with the core, attract the left-hand blade. This latter has a platinum contact which makes and breaks on the second platinum contact fitted in the right-hand blade. The platinums are always in view, and can be adjusted exactly opposite each other with the greatest ease, the movement is extremely rapid, and the adjusting screw has no platinum on it at all, and simply serves to adjust the speed of the trembler. It is claimed this coil takes very little current indeed. It is made in single-cylinder and twin-cylinder patterns by W. and R. Jacobs, 39c, King William Streeet, E.C.



Readers will be interested to hear that Mr. Cook, the winner of the first motor cycle race at Brooklands, uses a Duco Flex belt on his 7 h.p. N.L.G. Few belts will stand the strain of a 7 h.p. engine.

A YORKSHIRE LEGEND.

The firelight glints in eager eyes,
In the inglenook; and like a book,
With every look of candour frank,
The old man spreads himself, and lies
Of things oft-told: of buried gold;
How Edwin bold was badly sold
In days of old, on Sutton Bank.

* * * *

Angeline was a maiden fair,
Fascinating purple eyes and hair.
She was Edwin's—temporary—joy.
Edwin was—pro tem.—her darling boy.

Angeline went one week in May
To her aunt in Helmsley; and a day
Later came a wire from Edwin: "I'm
Motor cycling down, arriving nine."

* * * *

'Twas nearly nine o'clock
And Thirsk was at his back,
When Edwin got a shock;
The engine gave a knock
In sympathy.
Before him Sutton Bank
Upreared. His cardiac
Proportionately sank
As, steeply up its flank,
A dim path he
Discerned, gyrating high
To distant regions; where,
Beyond the eastern sky,
The Land of Bye-and-bye,
Wept Angeline.

"May I misfire before
I fail my tryst with her!"
Across the bridge he tore,
Shouting "Excelsior!"
To his machine.

Three times he stormed the hill,
Before he passed the "trough."
Three times again, until
He got a frightful spill
At Big Tree Bend.

"No beastly 'one in four'
Is going to shunt me off
From her whom I adore.
This struggle must," he swore,
"In victory end."

A window far on high,
Beneath the hill's black brow,
Mirrored the sunset sky,
And gleamed, a bloodshot eye,
In angry frown.

Young Edwin frowned as black,
And quoted "Do it now."
He tried six times; alack!
Six times he turned him back
The hill adown.

Then, more or less insane,
He turned, a thirteenth time,
Machine and self again
To face those hairpins twain
Of Sutton Bank.

With scarce a slackened wheel
Beyond the "trough" they climb;
Now round the corner reel;
Then, as the steep they feel,
Hope-lingering-sank!

Then cried he in his need,
"To pass that second bend
I'd sell my soul." "*Agreed!*"
The motor picked up speed
And snorted loud.

AGREED! What did it mean?
Or did his fancy lend
Voice to some Thing unseen,
That shadowed his machine,
And mocked and mowed?

Or was it—horror dread—
It was! . . . His heart stood still.
Upon the engine head
He saw an imp, who said,
With thumb to nose,

"AGREED! Observe we flash,
Like petrol flame, uphill—
Now round the corner dash,
And now—O Edwin rash—
Your bargain close!"

* * * *

And now, they say,
Each year in May,
A spectral motor climbs the Bank
With glowing cylinder and tank
And clears the bends—
But there it ends,
And vanishes afire!

For Edwin sold his soul to round
That second bend, before he found
'Twas all in vain
He'd ne'er attain
The TOP: *'twas some yards higher!*

H. R. T.

MOTOR CYCLING FOR HEALTH.

(*Concluded from page 479.*)

J. H. Fergurson, M.R.C.S. Lond., L.R.C.P. Lond.

(1.) In my experience motor cycling is a healthy and pleasant pastime. (2.) The motor cycle is a most useful and time-saving invention. (3.) Half. (4.) A good 4-5 h.p. single-cylinder tricar, two-speed gear, and arranged so as to protect rider from mud splashing in sloppy weather. My mount is a 3 h.p. Centaur (three-wheeler) with a Phelon and Moore two-speed gear, which in my experience leaves nothing further to be desired. I have had the combination over four years in daily use, and in all kinds of weather. I have ordered a 5 h.p. Centaur tricar, as the hills in this district (Keighley) are severe.

Dr. Bletsoe.

Charles Patterson, M.B., M.R.C.S.

Have used a motor bicycle for four years in my practice and average 10,000 miles a year over hilly country. As regards my own health, I have never been better, and despite the fact that there are no spring forks or saddle-pillar fitted to my four-year old single speed machine, the vibration (the bogey of motor cycling) over our bad roads has neither unsteadied my hand nor shaken my nerves. I could write from now to next year giving instances where the motor cycle, and the motor cycle alone, has made the difference to the ultimate recovery of serious cases. A motor cycle always ready day and night in the stable makes a country doctor as much on the spot in a district of seven miles radius as his town brother who comes one mile all round on foot. I have for the last two winters driven a 10 h.p. single-cylinder car. It costs me over £120 a year. When I used a motor cycle alone (2½ years) the expense worked out at £33 per annum, which includes a bill of £8 for charging accumulators as I live nine miles from a charging station. The motor cycle for a hilly country and for a heavy man should be 3½ h.p. single-cylinder, belt drive (rubber), with adjustable pulley, two speeds (absolutely essential), preferably epicyclic in hub, pedals, non-skid tyres, and detachable tubes, the whole as light as possible. For four years I have used Palmer tyres, and only once had a side-slip (on ice coming down 1 in 9 on frozen snow).

G. Percival Adamson, B.A., M.B.

As a pioneer, my motor cycling dates back to De Dion tricycle days, followed by several years of tricar life. During that time I enjoyed excellent health through all conditions of weather. With regard to utility, this is where the motor cycle scores—it is convenient to handle, store, clean, move in and out of garage, is speedy and reliable. The cost, as far as general professional expense is concerned, is negligible. In my case a tricar displaced two horses, and the man was left at home at more productive work than sitting still.

Dr. Percival Adamson.

OCCASIONAL COMMENTS.

By "IXION."

Front Wheel Stands.

I have had several letters *re* front wheel stands to assist in wheel adjustment, replacing the inner tubes after repairing punctures, etc. If an extra carrier is not desired, it seems to me that the best device is a stumpy hinged support under the front of the engine crank case, on the lines of that brought out by the Bat people in 1902. One sidecar enthusiast has shown me a small solid wood block, which forms a cradle for his crank case, but while light in weight it is too bulky for a solo mount. A long distance tourist has sent me drawings of a combined front wheel stand and carrier; he fitted an extra long front wheel spindle, and fitted an adapted Main-Hilton stand carrier to it; and, finally, I have had a telescopic stand submitted which I have asked my editor to illustrate as soon as it is perfected. The point is that every rider should be able to procure a front wheel stand from stock to fit his machine, instead of, as at present, having to get one specially made.

Tyres.

I have just been examining a tyre which has run for two whole years on the front wheel of a twin Vindec without being removed and without puncture, and it is to all appearance still good for many a mile. If the tyre companies can produce a front wheel tyre which so largely exceeds the standard of our necessary requirements, it is the greatest pity that some of them cannot turn out a rear wheel tyre which will in ordinary circumstances go through, at any rate, one year of, say, 5,000 to 7,000 miles without wearing down to the fabric, bursting, or puncturing. We shall see about eighty riders start from Land's End for a 900 miles jaunt in July, and not one of them will have any real expectation of getting through without a puncture. In 1906 several men had upwards of a dozen, though starting with new tyres. The tyre companies refuse to understand that the amateur buyer controls the tyre demand. They think they must listen to the manufacturer's buyer. They show him a nice sensible cover of big cross section with 3/8in. of material (I dare not always say "rubber") on the tread. "A beautiful tyre!" he ejaculates. "But, my dear sir, it is too puddingy for words! Do you think our customers could win hill-climbs with a tyre like that? We want something narrow and light and resilient and cheap. If we fit a 50s. cover to the rear wheel, we shall have to put our prices up, and then we shall be undersold!" So the tyre makers scrap the beautiful reliable sample, and sell him a couple of thousand of light sprint tyres about as sound for road work as single tube Constrictors would be sound for a retired 16 stone colonel's pedal tricycle. The buyer is right. He must list a cheap tyre as his standard; he must fit a semi-racing tyre as his standard. But amongst the great army of motor cyclists there are hundreds of men who would gladly pay £1 10s. extra to have their machine sent out with a much wider rear rim and a rear tyre with some solid depth of substance on the road. Makers, therefore, should co-operate with the tyre firms to list what is practically a voiturette rear tyre as an extra on a special rim and wheel, a tyre which would go through an ordinary year without appreciable wear and without puncture. A. G. Reynolds is one of the few riders with sufficient enterprise to effect this transformation for himself. On the rear wheel of his 2¾ h.p. Bat he has a voiturette car tyre, and he says it has doubled the machine's comfort and reliability.

Ladies' Motor Bicycles.

Miss F. M. Crombie has very kindly sent me a picture of herself with her Matchless machine, which I have asked the editor to insert in my comments this week. It has a 2½ h.p. Jap engine, with automatic lubrication, complete handle-bar control, 2in. tyres, spring forks, spring rear frame, scales about 100 lbs. all on, and will carry her weight up "almost any main road hill." She says "she would not go back to the push bicycle at any price," and so I hope she will be an apostle of motor cycling for ladies in her native district.

Miss F. M. Crombie.

QUESTION & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied with a stamped addressed envelope for reply.

Misfiring at High Speeds.

I have a 3½ h.p. motor bicycle, accumulator ignition, trembler coil, which pulls well on hills, but as soon as it gets on the level and I advance spark for speed it commences to misfire. Carburetter clean, good spark at plug. Thanks to *The Motor Cycle* it has made things easy for me up to now.—NOVICE, Burnley.

The trouble is probably due to the carburetter not receiving sufficient air at high speeds. A larger choke tube might be tried with advantage. If the misfiring does not disappear try cleaning and adjusting the contact maker and the platinum points of the coil.

Fitting an Auxiliary Air Inlet.

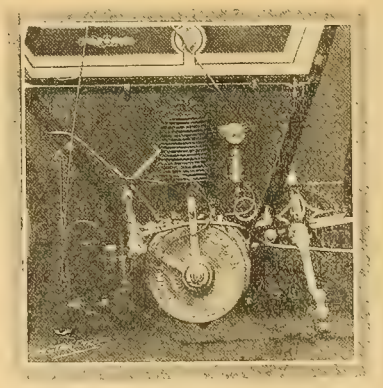
I recently fitted an undershield (leather) to my 9 h.p. Singer tricar. It seems to affect the air supply, as I found I could not get sufficient air to carburetter unless I removed the wire gauze from the air inlet. Would an additional air inlet help matters, and what kind would you advise, automatic or regulated by hand?—J.P.

We should advise an extra air inlet in the shape of a tap screwed into the inlet pipe above the throttle, so that when you are running fast you can open the tap full, and when descending a hill you can close the throttle and leave the tap open, thus cooling the engine. In warmer weather you might obtain better results by using the next size larger air adapter.

A Seven Days' Tour in France.

A party of four of us intend starting from here in June, getting to Boulogne, and from there striking southwards, our tour to take seven full days, in two 5 h.p. tricars, weighing 4½ cwt. each. Will you kindly inform me on the following points: (1.) Cheapest way to get to Boulogne? (2.) Route to take from Boulogne? We wish to do about 130-150 miles per day. (3.) Do you consider it a good tour? We shall have a French scholar and mechanic with us. (4.) Is it likely to be expensive?—H.E.S., Catford.

(1.) First of all, we should recommend one or all of your party to join the A.C.U., so that you will be able to enjoy the special touring facilities offered by the R.A.C., to which the A.C.U. is affiliated. The latter will get your machines through the customs, and you may pay the deposit on them in London; they will get your tickets and make arrangements for the machines to be taken on the boat, and give you every assistance. We should recommend you to get through them a "Guide Taride" and the "Annuaire de Route" of the French Automobile Club. The latter is most useful, as it gives the names of the best hotels. The cheapest way to get to Boulogne would be to drive the machines down to Folkestone, and then put them on the boat. If you take them by the cargo boat it will cost a little less. We should almost advise you to go to Havre instead of Boulogne, as it brings you into a more interesting country, and you will save a day's journey of 150 miles at least. (2.) A good seven days' trip would be



A Fit-all two-speed engine-shaft gear fitted to a 1907 Triumph.

the following: If you start from Boulogne it will be quite a day's run if you get to Rouen; if you start from Havre you will be able to go through Rouen to Chartres the first day, and Orleans, Blois, Tours, and Angers the second day. All the places are extremely interesting, and if you care for sight-seeing you should take two days over this part of the trip. This will take you down the valley of the Loire, which is extremely picturesque, and when you have reached Angers you will not be far from the western coast, where the scenery is rather fine. Places worth visiting are: Vannes, whence you can make an excursion to Quiberon, you can then go to Roscoff, through Quimperle, Chateaulin, and Morlaix. You can then head your way along the coast through St. Malo, Avranches, Caen, Lisieux, Bernay, Rouen, Caudebec, and Havre. You will be able to follow this little tour out quite comfortably by referring to the Guide Michelin, which can be obtained from the Michelin Tyre Co., 49-50, Sussex Place, Kensington, S.W. An excellent map is given with this publication. (3.) You will find this to be an excellent tour. We have not divided it up into days. Did we do so you would probably never adhere to them. So many objects of interest always crop up which hopelessly alter one's original plans. The roads are likely to be excellent, and you can nearly always shorten your journey by cutting off corners if you are pressed for time. (4.) The cost at first-class hotels will be less than that of touring in England. When once over the water you will do well to follow the hotels recommended by the French A.C., and only stop at villages with not more than 2,000 inhabitants.

Clearance between Valv and Tappet.

My 1907 5½ h.p. Rex de Luxe has lost all the compression it had a few weeks ago. It seems to have a little in the rear cylinder, but none at all in the fore. I have had off both cylinders and have ground in both exhaust valves, but this has done no good. The piston rings are quite correct, but I notice in the fore cylinder, part of the piston just below the rings, seems to have been knocked or blown off. Would this affect the compression? The exhaust valves also do not seem to have any clearance between the tappet rods. How can I remedy this, and what should the clearance be? The engine also will hardly take any air from Longuemare carburetter, even although the six holes on bottom of same are closed with a shield for slow running.—S.H.A., N.B.

The fact of there being no clearance between the exhaust valves and stems accounts for the absence of compression. The inlet valves may also want grinding in. You should examine the exhaust valve seating and see if there is any crack, also notice if the piston is cracked. The small fault in the latter which you mention should not affect the compression to any extent. The clearance between the tappets and the exhaust valves should be 1-32in., and

the ends of the valves must be filed off until this clearance is obtained. You might overhaul your carburetter for obstructions, and if after thoroughly cleaning all passages the engine will still take no more air, you might try a larger jet or smaller adapter.

Periodical Attention to a Motor Cycle.

My mount is a 1908 Triumph. (1.) Should I keep the two oil reservoirs of magneto filled with oil, and what oil should I use for the magneto? (2.) Is it true that I should keep the spark lever fully advanced and never touch it? (3.) How often should the cylinder be cleaned out?—BK 423.

(1.) Yes. Water-cooled engine oil is more suitable. After a few weeks running remove the screws underneath the reservoirs to drain all the oil out and swill with paraffin. Then fill up again with clean oil. (2.) In the case of the machine named, the spark is timed in such a way that the lever does not require altering except on a very severe hill, when it might be an advantage to retard the lever one or two notches at the most. (3.) The cylinder head should not require to be cleaned under 1,000 miles running, but clean out the crankcase with paraffin oftener than this.

Respecting a Passenger Attachment.

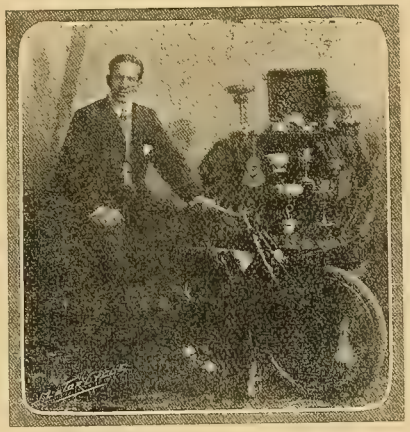
I am about ordering a 1908 Phelon and Moore 3½ h.p. magneto. (1.) Is the above bicycle capable of taking a Montgomery sidecarriage when rider weighs eleven stones and passenger fourteen stones. (2.) Would this combination, if fitted with the new Montgomery non-slipping attachment absolutely obviate sideslip (a) with passenger, (b) without passenger? (3.) In case the bicycle with sidecar would not be and could not be rendered free from skidding for regular winter riding would the bicycle above-mentioned be able to carry driver and passenger by means of Chater-Lea forecar attachment when hills of two or three miles might be encountered on the journey? (4.) Would the fitting of Goodrich tyres obviate any sideslip which the Montgomery attachment would not prevent, even when riding without passenger? (5.) In case I should decide to have the Goodrich non-skid on my tyres would it be better to have it vulcanised on the extra heavy Clinchers which go with the P. and M., or to have them changed for the Goodrich tyres?—M.A.K.

(1.) The machine in question would be quite up to the work. (2.) There would be very little risk of sideslip if you had a non-skid on the bicycle. (3.) Yes, a forecar attachment could be easily fitted if desired, but might be likely to cause overheating owing to the position of the engine. (4.) Undoubtedly, the fitting of these tyres would obviate sideslip until the rubber studs were worn down. (5.) The best plan would be to fit extra heavy Clincher tyres at first and use them until the corrugations are worn off, and then send them away and have the Goodrich tread vulcanised on to them.

The Correct Method of Driving.

I have a 3 h.p. Triumph magneto, purchased second-hand, and I am not certain whether my method of driving is correct. I drive as follows: Spark as far advanced as it will go without making the engine knock. Throttle almost closed, and as much air as engine will take without missing fire. On climbing a hill I open throttle, and if the engine begins knocking I gradually retard spark, and at the same time shut off a little air. I must say that the machine is in very good condition, and is very fast on the level, but knocks a bit on a steep hill. I have cleaned all deposit off piston and cylinder head, fitted new rings, and ground in valves. Also I can detect no vertical play on the connecting rod bearings. —E.R., N.B.

Your method of driving is apparently quite correct. You might, however, try closing the air first and then retarding the spark, but if you retard the spark too much owing to weak spark and late timing, engine will get hot and knock. You do not mention the ratio of the gear and your weight. Possibly you are geared too high.



Mr. Pat Stewart, of Poona, India, with his collection of motor cycling trophies, and his favourite mount, a Twin Brown.

Opinion of Machine Wanted.

(1.) Is the twin Roc a suitable machine for touring? (2.) Would it be any good to enter for hill-climbs? (3.) Is the speed gear thoroughly reliable? (4.) Is it economical? What will it cover on one gallon of spirit? (5.) What speed on a level road with a rider of about nine stones up? (6.) Is it comfortable, vibrationless, and noiseless?—GROSVENOR, Cheshire.

Unfortunately, we have not had a lengthy experience with the latest model. (1.) Yes. (2.) This is a question which we cannot very well answer. If tuned up there is no reason why it should not score in hill-climbs. (3.) The gear appears to be satisfactory. (4.) We should estimate the consumption to be, roughly, sixty miles to the gallon. (5.) Maximum fifty miles an hour, average over thirty. (6.) The machine appears to be vibrationless and comfortable.

Calculating the Gear.

My machine is a 3½ h.p. Peugeot engine in a Chater-Lea frame with Longuemare carburetter and plain coil. The circumference of belt pulley (inside measurements) on the engine is 10in., and on back wheel 55in. Back wheel is fitted with a 26in. by 2¼in. tyre. It is very fast on the flat, but seems to lack power on a stiffish hill, and will not run without misfiring unless I have the petrol nearly full on, and the spark well advanced. Do you think it is too highly geared? and what would be the gear from the above dimensions? I have the commutator well adjusted. —J.Y.N.C.

The dimensions you have given us will not give the gear accurately. What you should do is to mark the pulleys, wheel the machine along, and note how many times the engine pulley revolves to one revolution of the road wheel. This is the only correct method of obtaining the road gear. Your machine should be geared about 4¾ to 1.

Sluggish Starting due to Carburetter.

Please diagnose cure for following symptoms on 3½ h.p. 1907 Rex with magneto ignition. Machine will not start cold till pedalled over compression very fast, and then jumps off at full speed with spark fully advanced, throttle wide open, and air closed. It will then take very little gas, but I cannot open air lever. After running two miles or so it overheats and stops. Sometimes carburetter drips when standing if tap is left on.—S.I., Leeds.

The difficult starting is caused by too great an air supply. A smaller funnel in the carburetter would improve matters. The over-heating is certainly curious, and we cannot understand it. The carburetter should be so adjusted that you should be able to run with the throttle half open and three-quarters of the air, and almost full air when running uphill with the throttle full open. The flooding of the carburetter can be cured by grinding in the needle valve with crocus powder.

READERS' REPLIES

In reply to "Novice," page 457, you give a method of grinding in valves. Now if "Novice" has an obliging friend to hold the cylinder the following, I have found, is much easier and quicker than the screwdriver method: Get an ordinary joiner's brace and fit a screwdriver bit into it. The assistant should hold the cylinder in a horizontal position, while one turns the brace, easing up the valve every now and again to let the emery get a fresh grip. I hope that this tip may save some brother motorist from long hours of tedious labour.—A. SOMMERVILLE.

[It is quite true a brace can be used when cylinder is removed. Or if one has access to a vertical drilling machine grinding in can be done by power if care is used to prevent scoring.—ED.]

London to Edinburgh and Back.

FOR some days previous to the closing of the entry list for the M.C.C. annual twenty-four hours' run I had not made up my mind whether to compete, but finally sent in an entry form giving particulars of my 5 h.p. Rex motor bicycle, to which I pinned my faith to carry me over the four hundred miles separating London and Edinburgh in twenty-four hours, and also the return journey to London for the Schulte and Motor Cycling Club Cups. Preliminary details over, I commenced to prepare for my self-imposed task, the magnitude of which grew upon me as Friday, 5th June, the day for starting, drew near. As a training spin I rode from town to the A.C.U. hill-climb at Sutton Bank, near Thirsk, Yorkshire, a distance of 223 miles. My only worry was tyres, and the difficulty was to obtain a cover on which I could depend to stand the strain of a 5 h.p. twin over 800 miles, and also be free from punctures. I eventually obtained a 2¼in. Shamrock Excelsior rubber-studded cover, in which I fitted a Miraculum-filled tube, leaving the original cover supplied with the machine on the front wheel, but as things turned out, I found tyres cannot be too new at the start for a long distance ride. Two Rich detachable tubes formed my spares, and without them I should not have completed the trial. I also carried a good supply of inlet and exhaust valves, sparking plugs, nuts, bolts, and other small useful parts.

The Day of the Start.

On the Friday evening I made tracks for the Old Gate House, Highgate, arriving about 8.30, but on the way broke one of my pair of lamps over the vile surface of Finchley Road, and I thought this a bad omen at this early period. A large crowd had already collected, and a good number of competitors' motor cycles and cars lined up in their respective positions on both sides of the road. Of the chief marshal I obtained my numbered armlets, two short streamers of green ribbon for tying to the handle-bar to denote "return journey man," and also two bundles of numbered tear-off tags for handing to the checkers along the road. After answering many enquiries as to whether I was "feeling fit" and attending to the "inner man," I obeyed the marshal's instructions, and lined up in single file with the rest, there being only four or five absentees from the record total of 135 entries. On the stroke of ten o'clock Mr. F. T. Bidlake gave the first man word to "go," and this was the signal for a hearty cheer from the thousands of spectators gathered around, who extended almost without intermission to Barnet. The cheering recurred at intervals as each man was despatched into the darkness.

Rain at the Start.

Whilst waiting for my turn to start the sky became very black and overcast, and I felt a spot or two of rain. "Ten seconds," "Five seconds," "Get ready," "Go," and I found my machine being pushed by willing hands to get the engine to fire, which it did instantly. Once clear of the tramlines, I settled down to a steady bat, and, with the engine humming nicely, I soon arrived at Hatfield, where I came upon the official checker quite unexpectedly several minutes ahead of time. This sort of thing would not win me the Schulte Cup, so I went on a little steadier to Biggleswade, where I arrived dead on time. The rain about here made matters uncomfortable. After filling up with petrol I started off for Grantham, where the competitors had been kindly invited to breakfast at the George Hotel by Mrs. Marshall. In the meantime my lamp gave up the ghost, and I rode behind a large car with powerful headlights for some distance until at 2.15 a.m. it was light enough to see the road. I passed several of the other competitors on this stretch, all of whom seemed to be going well. I was cold and hungry on arriving at Grantham, and scampered in for warmth and a welcome repast. By this time the rain had cleared off, and a fine day looked promising. The run to Wetherby seemed the longest hundred miles stretch of the ride, and, peculiarly, the second hundred on the return journey also seemed of indefinite length. I had nothing to trouble about, and ambled along at an easy pace, occasionally passing a competitor busy with his puncture outfit. My twin seemed to revel in its work, and Wetherby was reached with plenty of time in hand. Whilst partaking of the second breakfast reports came in of serious accidents in the dark to two or three competitors. Rumours of police traps were heard, and everybody henceforth kept a keen look-out.

Tyres the Chief Trouble.

The high wind in the teeth of the competitors must have set the low powered machines a severe task—in fact, I passed several competitors pedalling on hills, but few appeared to have mechanical troubles, tyres causing the most stops. The next halt was Newcastle for luncheon, and the point which struck me most on this portion of the ride was the excellent marking of the route with the M.C.C. arrows, by the Newcastle and District Motor Cycle Club. This was especially noticeable near Durham, which city was avoided by making a detour of two or three miles. Mr. S. W. Carty was in charge of the checking sheet, and I signed on feeling as fit as the proverbial fiddle. Luncheon added renewed vigour, and after obtaining petrol and oil, and wiping some of the dust off the machine, I set out for Edinburgh on the last hundred. My only difficulty now was to find a comfortable position in which to sit, and my wrists also commenced to ache. The wind had almost dropped, and the dust contained a little less coal. At all the checking stations where I stopped there were numerous enquiries after the lady competitor, Miss Muriel Hind, and everybody admired her pluck and endurance. After leaving Newcastle, the coast road was taken, and a refreshing breeze told me of the proximity of the sea, which shortly came into view.

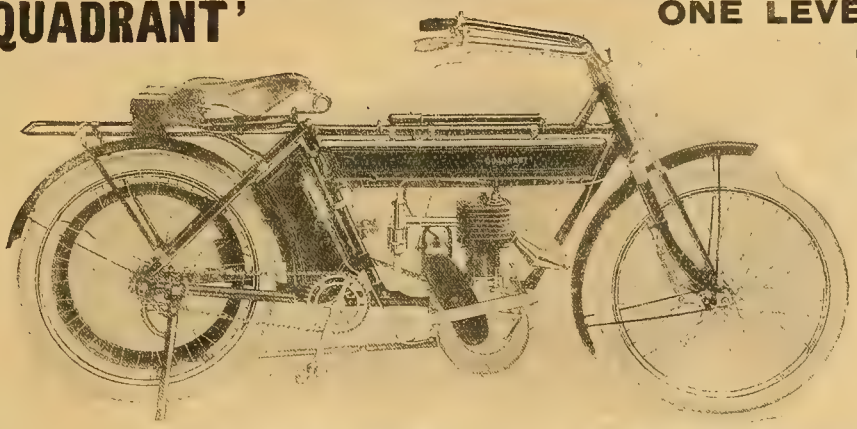
The Finish of the Long Run.

Some of the competitors, after signing at Berwick-on-Tweed, where tea was provided, seemed to desire to reach Edinburgh in as short a time as possible, and I will admit I arrived at Levenhall with plenty of time to spare. We were then directed to the Royal Hotel, where we signed the final checking sheet, and the Schulte Cup competitors' machines were locked up in a special garage by the officials, to be handed back to the owners half an hour before starting time on Sunday at midnight. After dinner, having recounted

The New 'QUADRANT'

3½ h.p., M.O.V.

ONE LEVER only controls it from handle bar.



"LIKE AN ARM-CHAIR"

All riders are agreed in opinion as to its extreme comfort, many of them expressing themselves in the same words—"It is like riding in an arm-chair."

Very low frame. Takes every hill in the kingdom. Very fast. Gentleness itself in traffic. Starts instantly. Control simply perfect.

A few A.O.V. models at bargain prices.

Makers: THE QUADRANT MOTOR CO., LTD., Earlsdon, COVENTRY.
(Late of Birmingham.) *Please note correct address.*
REPAIRS: Genuine Quadrant parts for all Quadrant engines.

SPECIAL OFFER OF THE RELIABLE

'DIAMOND' Motor Cycles

The last word in Motor-cycle construction and the product of [redacted] RIDING EXPERIENCE.

In order to introduce these splendid machines to the MOTOR CYCLING PUBLIC we are prepared to supply a limited number to RIDERS living in districts where these machines are not known, at the following SPECIAL PRICES.

2½ h.p. A O I V, 70 × 80	Usual Price,	£26 10s.	SPECIAL PRICE, £21
*3½ h.p. M O V, 78 × 84	,, ,,	£37 10s.	,, ,, £28
*4 h.p. Twin Cylinder, A O I V, 66 × 72	,, ,,	£45	,, ,, £36
*5 h.p. Twin Cylinder, M O V, 73 × 78	,, ,,	£47 10s.	,, ,, £38

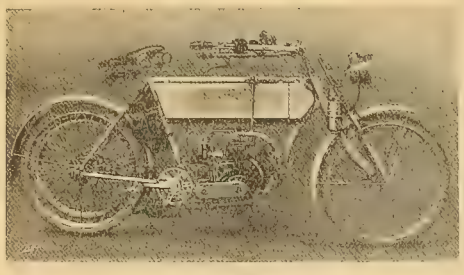
* Fitted with Special Spring Forks. No Side Play.

ALL MODELS FITTED WITH BOSCH MAGNETO. These are STANDARD MACHINES in every respect, and are NOT SPECIALLY BUILT to sell at special rates.

Full Particulars from:

The VICTORIA TRADING Co.,
47, Lamb's Conduit St., Theobald's Road,
LONDON, W.C.

Telephone: 2797, *HOLBORN.*



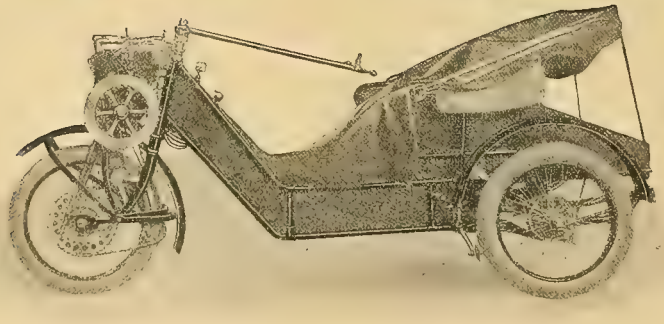
4 h.p. Model.

PALMER TYRES

The Palmer Motor Cycle Tyres are treaded with the well-known "rib," being designed to give a better grip on greasy roads. No side-slip attachments are needed with this ribbed tyre. The Palmer Motor Cycle Tyre for the same reason has a much smaller contact area with the road, giving a firmer grip and higher speed with less slip. Send for fully descriptive Booklet to

THE PALMER TYRE LTD.,
119. 121. 123. SHAFTESBURY AVENUE. LONDON. W.C.

The Phenomobile



solves the problem of the **Sociable** Tricar.

The Phenomobile combines the simplicity and low cost of upkeep of a Motor Cycle with the comfort and efficiency of a Car. In one vital point it even excels any motor-propelled vehicle: It is **entirely free from sideslip.** There are many other advantages which the Phenomobile possesses over the ordinary type of Tricar, and we shall be pleased to furnish you with full particulars on receipt of a postcard. Prices from **105 guineas.**

Sole Concessionnaires:

THE NEW ERA MOTOR CO., 6, Lonsdale Road, West Kilburn, LONDON, N.W.

Telephone: 3019 P. Hampstead.

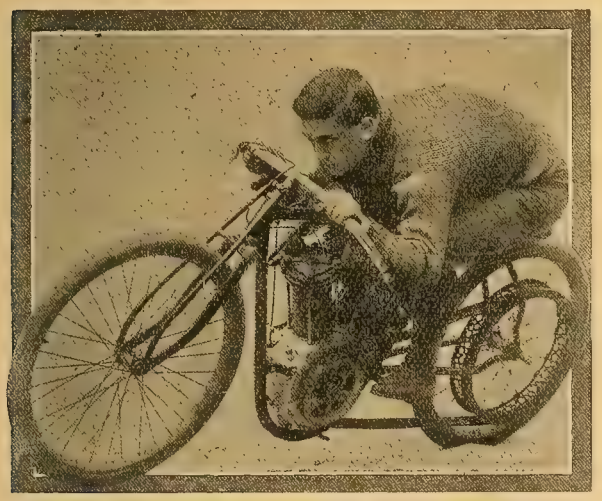
In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

London to Edinburgh and Back.—

a few adventures with the other competitors, I turned in for a good night's rest, with a very satisfied feeling. Nearly one hundred of those who started duly arrived in Edinburgh inside thirty hours—a very good proof of the reliability of the modern machine. I was not about very early next morning, and those competitors who had not to make the return ride started for home by different routes, some going by road through Kendal and the Lake District. On Sunday it rained nearly all day, and the return journey men rested quietly. Activities commenced again about 11 p.m., and we all made the most of the half hour allowed to prepare our travel-stained steeds for the return run.

Commencement of the Return Journey.

I was given the word "Go" at 12.46, and was off again to cover that long distance separating the two capitals full of hope. The rain had ceased, and the night was beautifully clear—in fact, at 2 a.m. I dispensed with the lamp, as I could see well enough to avoid the rabbits which abounded. I kept company with Godfrey and Winslow, both on Rex machines, and we ran through to Berwick, which was the first breakfast stop, like clockwork. The only incident on this



Geo. A. Barnes, "the English cannon ball" as he is called in Paris, on his new 14 h.p. racing machine.

stretch was the difficulty experienced in getting over the vile cobbled surface of Dunbar. After feeding, I procured a gaiter for the front tyre, out of which a piece had been cut by some sharp stone, and repaired my rubber belt, the fastener having pulled through. Off again punctually to schedule. Perfect travelling conditions prevailed, the day commencing warm. A few miles out of Berwick my back tyre went down, the valve of the tube containing the Miraculum having pulled out, to which I do not attach any blame. I threw the tube away, and quickly fitted one of the Rich detachables.

All the cup competitors' machines seemed to be running perfectly, the lame ducks having dropped out on the journey north. Some of the competitors must have been endowed with the patience of Job himself, keeping so strictly to 20 m.p.h., actually arriving in controls within seconds of schedule. I found the short distance over which I kept strictly to time very tedious work. A very excellent system of secret checks was adopted, a car travelling in front of the riders dropping a timekeeper, who would secret himself in the hedge and take the competitors' times as they passed, to be picked up later by another car following in the rear.

Two Policemen up a Tree.

On two or three occasions, until I became accustomed to this arrangement, I took the timekeeper to be an assistant in a police trap, of which there were several of the long distance variety along the road, and in one place I espied two men comfortably ensconced up a tree. Only two or three competitors were caught, however. At Newcastle the second breakfast was ready, and once more replenishing the tank, we set out for Wetherby. Beyond care in passing several flocks of sheep and herds of cattle, I had nothing to do but steer and give the engine a pumpful of oil every few miles. Once I caught up the leading official car, but was promptly warned to keep in the rear, and popped along very slowly to the luncheon place, which marked the completion of three parts of my task. At Wetherby the competitors were warned that the police were everywhere as far as Grantham, and this proved rather awkward, as I had two or three punctures and had to make up time. I, however, managed to reach Grantham, where tea was waiting, to schedule, after going very slowly on account of a police trap outside the town. Then I experienced a whole host of tyre troubles. Five miles out I damaged my second spare tube beyond repair, and I had to insert a 2in. tube, kindly lent me by a passing motor cyclist. This necessitated taking the back wheel out on the road, which delayed me an hour, and to make up I was obliged to travel very fast to Biggleswade, fifty-five miles away. Replenishing the petrol tank for the last time, I lit the lamp for the thirty-five miles to Barnet. The machine ran perfectly until about three miles out, when the belt fastener again pulled through. Nothing less than a 1in. belt is strong enough for a 5 h.p. twin. I was in a predicament, as the belt was now too short, but managed to rig this up satisfactorily, and duly arrived in Barnet about 11 p.m., where Bidlake again officiated with the watch, and I thus qualified for the Schulte medal. The return journey did not seem nearly so long as the outward run, probably because the ground was now more familiar to me. I felt quite fit bodily, but sleepy. I supped at the "Old Sal," and then made for the west of London. Some of the riders seemed loth to leave the hospitality of the hotel, and slept there the night. Next morning, after a good night's rest, I felt almost sorry I was not due away at midnight on the return journey again, so enjoyable had been the run. Barring tyre troubles and the belt pulling through, not a single detail of the twin-cylinder T.T. Rex required attention. The marking of the route and general organisation of the run were excellent, and did great credit to the officials of the Motor Cycling Club responsible.

H. P. BEASLEY.

Readers who are in possession of worn leather or rubber V belts need not discard these as useless. Price and Co., 11, Mount Pleasant, E.C., have brought out some grips called the Ukantes, which can be affixed to the belt at intervals of about 2½in. These pack the belt up in the groove of the pulley, and prevent it slipping through touching the bottom of the groove. We understand that quite a large business is being done in them.

End-to-end Records.

The list of Land's End to John o'-Groat's records given at the end of April requires revision, as three out of the four mentioned have been broken during the present month. The new records are: Motor bicycle, 41h. 28m.; motor car, 42h. 5m.; pedal bicycle, 3 days 5h. 20m.; walking, just under 17 days.

A Good Day's Run.

The Sunderland and District M.C.C. is celebrating Race Wednesday (to-day, June 24th) by having a run to Doncaster and back, starting at the early hour of 4.30 a.m. Race Wednesday is the principal day of the Newcastle Race Week, and one of the most popular holidays of the year along Tyneside and Wearside.

For Suppressing Furious Driving.

The Toronto police authorities have decided to adopt motor bicycles for use in catching motor car drivers who exceed the speed limit, and have selected Brown motor bicycles for the use of their staff.

A Midsummer Climb.

We hear that the S.E.A.C.A. has decided to promote a midsummer hill-climb on an entirely fresh hill in Kent. Competitors only will be advised of the location of the hill selected at the shortest possible notice, so that no possibility of police interference is to be anticipated.

Speed Limit at Croydon.

What with ten mile limits and long-distance traps, the Brighton Road will soon be impossible. Croydon has now applied for a ten miles limit on the Brighton Road, and also certain roads at Norwood.

Championship of France.

The Auto Cycle Club of France is organising an event styled Championnat de France de la Motocyclette, which is to be decided at the Parc des Princes track on the 23rd of July next, the distance being 100 kilometres. The contest will be confined to machines of French make with engines not exceeding 250 cm. capacity.

The Poor Man's Motor.

An interesting article appeared recently in the *Birmingham Daily Mail* entitled "The Poor Man's Motor, or Six Years' Experience of Motor Cycling." There is one paragraph in the article which we think requires confirmation, and that is the average speed on tour of a 2½ h.p. motor tricycle with trailer, stated to be twenty-two miles an hour. Years ago we had a lengthy experience of motor tricycles and trailers, and certainly cannot remember averaging twenty-two miles an hour. Tricycles were very efficient hill-climbers, and, suitably geared, would pull a trailer at an average speed of eighteen miles an hour, but we hardly think twenty-two miles an hour could be maintained for long distances.

FUTURE EVENTS.

June 24—London United Tramways Five Miles Tourist Motor Cycle Handicap at the Stadium.
" 27—M.C.C. INTER-TEAM TRIALS for "The Motor Cycle" Fifty Guineas Challenge Cup. Prospective Competitors: Motor Cycling Club, Coventry M.C., Great Yarmouth M.C.C., Birmingham M.C.C., Lincolnshire M.C.C., Liverpool M.C., North West London M.C.C., Sheffield and Hallamshire M.C.C., Manchester M.C., and Bocardo M.C.C. (Oxford).
" 27—Motor Cycle Union of Ireland Inter-centre Contest for the Triumph Cup.
" 27—Scottish Twelve Hours' Open Reliability Trial.
" ——A.C.U. 24 Hours' Ride, London to Plymouth and back.
July 4—Essex M.C. Open 200 Miles Non-stop Run.
" 6-7—A.C.F. Grand Prix Races for Car Voiturettes.
" 13-18—A.C.U. LAND'S END TO JOHN-O'-GROAT'S SIX DAYS' RELIABILITY TRIAL.
" 14-15—M.C.U.I. (Ulster Centre) Open 400 Miles Reliability Contest.
" 25—Motor Cycling Club Petrol Consumption Tests.
Aug. 8—Essex M.C. Open Race Meeting at the Stadium.
Sep. ——The International Auto Cycle Tourist Trophy Race in the Isle of Man.

New Police Traps.

In Grange Road, Northgate, Darlington, there is a trap 290 yards in length.

A mile outside Basingstoke, on the main road from London, a trap is being worked from the top and down a steep hill.

At Studley, Warwickshire, all motorists are timed over a quarter of a mile from Watt Road to Spernal Ash.

Motorists are timed over the straight stretch of road between Newark and Kelham.

There is a four miles trap on the Old Chester Road from the cross-roads at the Queensferry Road to a point near the canal bridge by Chester. (Worked on Sundays.)

Also one on the Broad Green-Roby Road, and one between Huyton Church and Prescot.

The Puncture Fiend Defied.

Few competitors in the M.C.C. London to Edinburgh and back trial can boast absolute immunity from tyre trouble, yet O. C. Godfrey, whose twin Rex had tubes charged with Miraculum, had no occasion to use the pump at all. We understand that several nails and pieces of iron were removed from the tyres *en route*, but none caused delay.

A Prominent North-country Motor Cyclist.

One of the most prominent men in the North Durham district who has adopted motor cycling as a hobby and a convenience is Major Ernest Vaux. He may be seen frequently riding from the middle of Sunderland into the rural district on its western boundary, where he has a pleasant estate—Herrington Hall, Grindon. Major Vaux, by the way, is one of the supporters of Lieut.-General Baden Powell's scheme of boy scouts, and it is at his Grindon estate that some of the Sunderland and London scouts, raised by the general, have been recently encamped.

The End-to-end Trial Next Month.

Intending competitors in the A.C.U. Land's End to John-o'-Groat's Six Days' Trial should note that entries definitely close on Saturday next, the 27th inst. In addition to the list of twenty-six entrants referred to last week, a number of further entries have been received, and it is expected that the list will be considerably swelled between now and Saturday.

The A.C.U. and Unattached Riders.

At a committee meeting of the A.C.U. on the 12th ult. the question of the association of unattached riders was referred to the Legislative Sub-committee. The report was that a scheme of association was not wanted, and should be rejected. This report was then submitted to the General Committee and accepted, and a resolution passed that an associate scheme be rejected. In the meantime it is worthy of note that the Brighton and District M.C.C. is enrolling associate members at 4s. per head, the South-eastern Auto Cycle Association at 5s., and among other advantages the last-mentioned club is just concluding an agreement for a reduced insurance policy. The Bradford M.C.C., and, we believe, the Newcastle and District M.C.C., have also similar schemes.

Our Black List.

A car bearing the registration letter K was driven at an excessively fast speed through Coventry on Friday last, about 2.20 p.m., considering the amount of traffic and the repairs being undertaken on the Birmingham Road.

Petrol in One Gallon Tins.

Regarding the paragraph recently published in these columns on the subject of one gallon tins of petrol, sealed and stoppered, Messrs. A. W. Heybourn and Co., High Street, Maidenhead, advise us that one gallon cans have been stocked by them for over a year. Large petrol distillers should note this.

Additional New Police Traps.

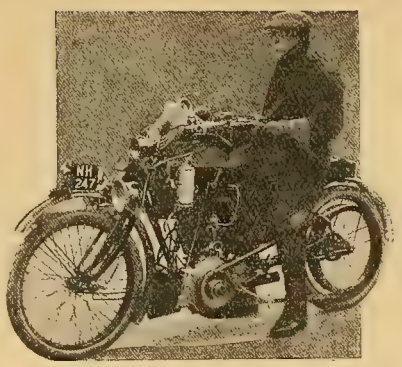
Between Llanfairfechan and Penmaenmawr on the Bangor-Conway Road, and on the Holyhead Road between Capel Curig and Bettws-y-Coed. These traps are working on Saturdays and Sundays, and are controlled by means of a flag, which is not always operated from the same place.

Flying Kilometre Races at Lyons.

The Motor Cycle Club of Lyons held races over a flying kilometre on the 21st. There were four classes. Class I., for motor cycles with engines not exceeding 250 cubic centimetres. Class II., not exceeding 333 cubic centimetres. Class III., not exceeding 500 cubic centimetres. Class IV., over 500 cubic centimetres. The results were: Class I., Pons (Peugeot), 59⅗s.; Class II., Ferrand (Magnat-Debon), 50⅗s.; Class III., Dravoub (Peugeot), 50s.; Class IV., Bouvard (Peugeot), 47⅗s. The time in Class IV. equals a speed of just under forty-seven miles an hour.

Amusing Evidence.

At Middlesbrough, last week, a Normanby motor cyclist was charged with riding a motor cycle to the danger of the public at South Bank on the 6th inst., at 11.15 p.m. A constable said immediately the motor cyclist passed him he increased his speed—he could tell by the beat of the machine. There were a number of people on the road. The defendant said that although he increased the speed regulator, owing to the fact that the belt was slipping, his machine travelled no faster, but the beat of the engine increased. He did not travel more than 15 m.p.h. that night, and rode carefully all the way home. The case was dismissed.



An amateur rider, C. H. Crole-Rees, who successfully rode his 6 h.p. Advance in the London to Coventry and Back Twelve Hours' Run, and the London to Edinburgh and Back Run.

An Aged Joke.

What reader has not heard and read more than once the story of the begoggled motor cyclist on his way to Regent's Park, enquiring of a boy if he was right for the Zoo? The stereotyped paragraph re-appeared in a "bits" paper last week, but the real joke, we presume, was that the paragraph was printed under the heading, "One guinea per column is paid for *original* contributions to this paper."

The End-to-end Trial Next Month.

Additional entries for the A.C.U. End-to-end Trial are: A. H. Ormerod (5 h.p. F.N.), J. O. M. Dixon (3½ h.p. Vindec Special), Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph), R. Moore (3½ h.p. P. and M.), A. D. Nicholson (3½ h.p. Triumph), H. N. Dommett (machine not stated), Robert King (3½ h.p. Triumph), J. Haslam (3½ h.p. Rex), F. W. Applebee (3½ h.p. Rex), and S. W. Carty (3½ h.p. N.S.U.)

A Display on the Track.

D. R. Clark gave a motor cycle display on the St. Alban's track in Clarence Park on Saturday afternoon in connection with the Garden Party and Evening Fête in aid of the Railwaymen's Convalescent Home, Herne Bay. Riding his 2¾ h.p. Century-Givaudan he accomplished the five miles in 6m. 36s. with a very strong head wind blowing over part of the track. His time was ⅘s. slower than Colver's, who holds the track record.

M.C.C. Team Competition.

Teams from the following clubs have been definitely entered for the M.C.C.'s 100 miles team trial for *The Motor Cycle* Cup: 1, Southern M.C.; 2, Coventry M.C.; 3, North West London M.C.C.; 4, Motor Cycling Club; 5, Bocardo M.C.C. (Oxford); 6, Sheffield and Hallamshire M.C.C.; 7, Great Yarmouth and District M.C.C.; 8, Manchester M.C. and 9, Birmingham M.C.C. In addition, an entry was expected at the time of going to press from the Lincolnshire M.C.C. If all the above teams compete on Saturday next it will be the largest number that has started for this event, and reflects great credit on the trials hon. sec., Mr. J. Van Hooydonk.

Important.

Competitors in the above team trial are hereby notified that in consequence of the very loose state of parts of the surface of Watling Street, between Daventry and Cross in Hand, the course has been altered from Watling Street to the Daventry, Byfield, and Chipping Warden road. This course includes one or two fairly steep hills.

Accommodation at Daventry.

Those motor cyclists who are competing in the M.C.C. Team Competition on Saturday next would be well advised to book their accommodation early. Daventry possesses several well-equipped hotels, but the accommodation is not unlimited. The principal hotels in the town are the Bear, the Peacock, and the Wheatsheaf, and they can accommodate about sixty.

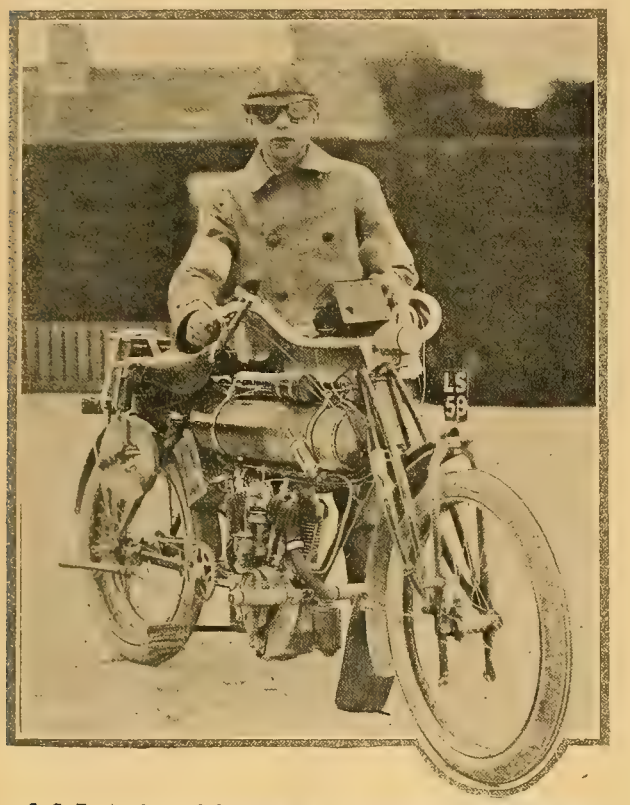
How to get Rich Quickly.

The following paragraph is culled from the *Bridport News*. Bridport is a small town situated between Weymouth and Exeter, and was at one time notorious as a smuggler's resort. "The Mayor asked why the Council should not put up a notice restricting motor cars to a speed of twelve miles an hour in passing through the town. When in Worcestershire quite recently a magistrate told him his Council made as much as £60 in one day in fines for motor cars exceeding the speed limit, *and he did not see why the Bridport Council should not get some money in this way* (Hear, hear, and laughter.) The Town Clerk agreed to look into the matter and report at their next meeting. (The italics are ours.)

Motor bicyclists and tricarists in the annual Woodford meet of decorated motor vehicles last Saturday.

The London-Edinburgh Medal Winners.

BELOW is an official list of medal winners in the London-Edinburgh competition. The names of the machines ridden were given in our report of the run, on page 463 of June 10th. Readers will learn with pleasure that the motor cyclists in the double journey of nearly eight hundred miles for the Schulte Cup and the special M.C.C. Cup made a very hard fight for the former trophy. S. G. Frost, who rode a 4½ h.p. twin-cylinder Minerva, was desperately near to Platt-Betts on an 8 h.p. Rover car, he being only ¼ of a mark behind, thus demonstrating that, apart from the advantage of speed measuring instruments, the skilled motor cyclist can run the cleverest car driver very close indeed. Platt-Betts, having now won the Schulte Cup twice in succession, becomes the absolute owner of it. S. G. Frost is adjudged to be the first winner of the M.C.C. Challenge Cup. This cup has to be won three times in all, not necessarily in succession, it then becomes the winner's property. A. G. Reynolds (3½ h.p. Vindec) was third.



S. G. Frost, winner of the special cup in the M.C.C. London-Edinburgh and back run. We understand that he very nearly won the Schulte Cup also. The machine is a twin-cylinder Minerva, with G.A. carburetter, Palmer tyres, Continental belt, and Brooks seat.

The following names have been passed by the committee for London to Edinburgh gold medals: Captain Sir R. R. Arbuthnot, Bart., R.N., D. S. Baddeley, L. A. Baddeley, J. L. Barratt, H. M. Bentley, R. G. Booth, Dr. E. W. Brewerton, A. T. Browett, A. J. Brown, J. F. Buckingham, P. S. Campariole, M. Campbell, W. Chater Lea, H. Childe, S. H. Clay, H. Collins, C. C. Cooke, H. Cowlin, T. F. Cox, F. Cozens, B. Cumberland, F. C. Dee, E. B. Dickson, J. O. M. Dixon, A. D. Draper, G. L. Fletcher, A. H. Forbes, H. S. Freeman, S. H. Fry, G. Gibson, W. Gunn, I. B. Hart-Davies, J. S. Harwood, F. T. Heighton, Miss Muriel Hind, J. Van Hooydonk, A. de S. Hutton, W. A. Jacobs, W. G. James, P. Janson, C. F. Lacey, Lieut. Gerald Lane, R.N., W. H. Lane, J. P. Le Grand, H. P. Mays, A. B. McDonald, Dr. C. B. Moss-Blundell, C. G. Myer, H. S. Myer, A. D. Mundy-Nicholson, V. Olsson, R. S. Parris, T. Pears, P. E. Quick, G. W. Raper, G. E. Roberts, G. Rowden, W. A. Sale, H. C. Sayer, C. J. Seed, F. G. Smith, A. J. Sproston, A. M. Tatham, A. Walton, Stanley Webb, W. H. Wells, F. White, and J. Winslow

Silver medals: W. H. Bishop and H. Williamson.

Double journey gold medals: H. P. Beasley, C. W. Brown, R. O. Clark, C. H. Crole-Rees, E. V. Fielder, S. G. Frost. E. Gwynne, O. C. Godfrey, F. J. Jenkins, A. S. Phillips, J. Platt-Betts, A. G. Reynolds, O. L. Summers, and Miss A. E. Wood.

A few names have been held over for further consideration by the committee at the next meeting. The medals and other awards will be distributed at the annual dinner, which will take place some time in December.

Details are now being arranged for the Chas. Jarrott Cup, London to Land's End and back competition, and will be sent to members in due course. The competition is open only to members of the club, so that all motor bicyclists who wish to take part in this event and are not already members of the club, should at once apply to the hon. secretary, Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W., for forms of membership.

The competition for the M.C.C. Trophy for cars has been postponed from July 11th to July 25th, and the Petrol Consumption Test will be held on September 12th.

ENTRIES FOR THE M.C.C. TEAM COMPETITION.

The very representative entry of nine teams of six riders has been received for the M.C.C. team competition at Daventry on Saturday, and the Lincolnshire M.C.C. entry was expected at the time of going to press. The clubs that have entered are: The Southern M.C., Coventry M.C., Motor Cycling Club, Bocardo M.C.C. (Oxford), Sheffield and Hallamshire M.C.C., North-west London M.C.C., Great Yarmouth and District M.C.C., Manchester M.C., and Birmingham M.C.C. The team to represent the M.C.C. for *The Motor Cycle* challenge cup on June 27th was selected at a meeting on Monday evening of last week, viz.: Motor bicyclists—E. Pond, Stanley Webb, R. M. Brice, and W. H. Wells; reserves—R. C. Davis and H. C. Slingo. Tricars—Dr. E. W. Brewerton and Frank Cozens; reserve—M. W. Randall.

"The Motor Cycle" Fifty Guinea Challenge Cup, to be competed for by teams representing nine different clubs at Daventry on Saturday.

Coventry M.C.

The following team will defend the title to the holders of the cup: Bicycles — F. Hulbert (3½ h.p. Triumph), W. Williamson (3½ h.p. Rex), F. C. Mustard (3½ h.p. Triumph), and I. B. Hart-Davies (3½ h.p. Triumph); reserves, G. E. Roberts and Geof. Smith (3½ h.p. Triumphs). Tricars—A. M. Startin (5 h.p. Riley) and G. Lee-Evans (6 h.p. Rex Litette); reserve, Stanley Riley (5 h.p. Riley).

The names of the riders representing the remaining seven clubs have not reached us. The trial starts from the Banbury Road, Daventry, at about 10 a.m. on Saturday next. The course is twelve and a half miles out, and the double journey will be covered twice before lunch and twice in the afternoon, making a total of 100 miles. For every mile covered without a stop one mark is awarded. Last year the highest score was made, namely, 534 out of a possible 600 by the Coventry M.C., but the course was more level than the one chosen for this year's trial. There are one or two hills on the Banbury Road which will test the competitors' skill in keeping their engines cool and also the power of their machines.

CLUB NEWS.

Perth and District M.C.C.

The run on Saturday last was much enjoyed. The route was by Dunkeld to Aberfeldy, where tea was served, continuing by Loch-na-Craig to Amulree, Methven, and Perth. The long climb from Aberfeldy was made more difficult by a strong head wind, but the magnificent view from the hill top was ample compensation. There was a good assembly of members.

York County M.C.C.

A twelve hours reliability run has been arranged for June 28th, and the committee are organising a twenty-four hours run from Leeds to Edinburgh and back for July 18th, the rider accomplishing the best performance to be awarded outright a valuable silver cup, kindly presented by the Palmer Tyre, Ltd. (see page 480). All members completing the run within twenty-four hours will be awarded the club's standard gold medal.

Hull and East Riding Auto Cycle Club.

On Saturday, July 4th, a hill-climbing contest will be held. Four classes have been arranged for, and the hill chosen is within twenty miles of Hull.

On July 11th the Scarborough reliability trial will be held, and a visit from the Scarborough Motor Club (reliability trial) will be made to-day (Wednesday), when members of the Hull Club will check the competitors.

Newcastle and District M.C.C.

The twelve hours trial from Newcastle to Edinburgh and back started on the 13th inst. at 8 p.m., *viâ* Ottercaps, Carter Fell, Jedburgh, Lauder, etc., returning from Edinburgh *viâ* Berwick on Sunday morning. Very severe weather conditions were experienced; heavy rain commenced to fall one hour after the start, and continued till 5 a.m., besides which there was a strong headwind. Twenty-five entries were received; eighteen men started, but a number retired. Those who finished in twelve hours were: G. W. Raper (6 h.p. N.S.U.), A. D. Nicholson (3½ h.p. Triumph), and K. Rheinlimit, and those riders who completed the run must be congratulated on a splendid performance.

Western District M.C. (London).

Members are reminded of the joint run on June 28th to Reigate with the Eastern District Motor Club. In the afternoon tea will be taken at the invitation of Mr. Leverton Harris at his residence at Dorking.

The above club held a reliability run to Salisbury and back on the 14th inst. for a silver cup given by the president. The method adopted to find the winner was as follows: Checkers took the time each rider passed them secretly at two points unknown to the competitors, both on the out and homeward journey, and they were also checked at Salisbury on arrival and departure. One mark was deducted for each ¼m. over or under a speed of twenty miles per hour. In spite of there being five different checking points, two of the competitors lost exactly the same number of marks, viz. sixteen, and they have decided to share the honour of holding the cup for twelve months. These competitors were only four minutes out on a distance of 140 miles. Result: R. Canham (3½ h.p. Brown) and H. Vowler (3½ h.p. Triumph), equal; W. Canham (3½ h.p. London), 3.

Richmond and District M.C.C.

A petrol consumption test and steering competition will be held on June 28th, when a gold and silver medal will be given to the first and second winners. The meet will take place at the Assembly Rooms, Surbiton, at 10 a.m. A picnic will take place at Leith Hill after the petrol consumption test, and lady friends of the members are invited.

Worcestershire M.C.C.

The first closed hill-climb was held on Saturday last on the Old Birmingham Road, between Marlbrook and the Lickey Monument, near Bromsgrove. There were twenty entries, and the results on formula are as follows:

Three competitors in the Lincolnshire M.C.C. Reliability Trial leaving the Spread Eagle Hotel, Lincoln.

SINGLE-CYLINDER CLASS.

	Fig. of merit
N. C. Pollock (3½ h.p. Rex)	64.23
G. Sanders (3½ h.p. Minerva)	61.26
W. Ward (3½ h.p. Triumph)	57.60
C. A. Williams (3½ h.p. Triumph)	57.56
A. Jennings (3½ h.p. Triumph)	56.20
H. C. Pickering (2½ h.p. Featherweight Rex)	56.10
R. T. Davies (3½ h.p. Triumph)	53.80
L. C. Wakeman (3½ h.p. Ariel)	42.06
W. A. Stuart (3½ h.p. Triumph), traffic stop.	

TWIN-CYLINDER CLASS.

F. H. Southam (5 h.p. Vindec)	58.11
L. Pickering (5 h.p. Rex)	55.68
H. J. Folkes (5 h.p. Rex)	51.02
R. N. Corah (5 h.p. Rex)	50.51
R. T. Wood (6 h.p. N.S.U.)	49.27
E. Burgess (5 h.p. Rex)	44.31
E. J. Smith (5 h.p. Roc)	35.59

Great assistance was rendered by Messrs. Rodway, Denley, and Burgess, who acted as timekeepers, and Mr. J. Weaver, of Bromsgrove, who superintended the weighing.

The special prize for the fastest time in the day was won by Mr. R. T. Wood (6 h.p. N.S.U.); time, 91⅔s.

Competitors in the Western District M.C. (London) Reliability Run to Salisbury and back.

Club News.—

Newcastle M.C.

The result of the reliability non-stop run from Newcastle to Jedburgh and back—a distance of 114 miles over the stiffest roads in the Border counties of England and Scotland—was: 1, Wm. Dunn (3½ h.p. Dene); 2, Isaac Baty (3½ h.p. Dene). Passenger class—T. Lee (Frank Tricar). Mr. Dunn wins the Allan Robson challenge shield. There were twenty competitors.

Scottish Twelve Hours Open Reliability Trial.

The Glasgow and Edinburgh M.C.C.'s have arranged a twelve hours reliability trial for Saturday, the 27th inst., on the same lines as the successful one promoted by these clubs last year. A very fine and interesting route, starting at Glasgow and finishing at Edinburgh, has been marked out, extending approximately to 228 miles. Full particulars and entry forms may be obtained from James S. Fulton, 131, West Regent Street, Glasgow; Campbell McGregor, 2, Greenhill Place, Edinburgh; or A. Allan Hay, 196, Bruntsfield Place, Edinburgh.

Inter-club Meet of the Lincolnshire M.C.C. and Hull A.C.C.

A most successful meet of the above clubs was held at Scawby Gull Ponds on Saturday. It was the second annual fixture of the kind, and was very well attended. After the interesting spectacle of tens of thousands of gulls had been witnessed a photograph was taken for *The Motor Cycle*, and the whole of the riders went on to Brigg and took tea at the Angel Hotel.

To-morrow (Thursday) the Lincolnshire Club has a hill-climb at Alford, and on Saturday one at Lambcroft Hill, Ludbrough. Entries to the hon. sec.

Shrewsbury "Aliens" M.C.C.

This club held its opening reliability run to Aberystwyth and back on the 14th inst., a distance of 153 miles, and the following members took part: Messrs. B. Ommeny (3½ h.p. Rex), C. Rice-Oxley (3½ h.p. Rex), A. Taylor (3½ h.p. Brown), C. Ommeny (3½ h.p. Rex), and J. O. Hughes (2½ h.p. Zedel). The route taken was *viâ* Welshpool, Newtown, Llangurig, through the magnificent scenery of the Plynlimmon district (where, however, the roads were bad and the gradients severe) to Aberystwyth. The return journey was made *viâ* Machynlleth, Newtown, Montgomery, to Shrewsbury. All finished without experiencing trouble with the exception of Taylor, the spindle of his front wheel breaking.

Inter-club Trial in Scotland.

On the 13th inst. the second annual competition for the Hamilton shield took place. The Edinburgh Club, as holders, had the management of this year's event. The test was a reliability trial of 100 miles and a hill-climb. Three teams entered—the holders (Edinburgh), Waverley, and Glasgow. Glasgow only had one starter, so from the very beginning it was almost hopeless. Result:

Edinburgh M.C.C.	4,427 marks
Edinburgh Waverley M.C.	3,765 ,,
Glasgow M.C.C.	973 ,,

Edinburgh M.C.C. was represented by four F.N.'s and one Vindec; Edinburgh Waverley, four Rovers and one Triumph; and Glasgow, one Triumph.

Times on the hill were on the whole very good. The fastest was the Vindec Special; second, F.N.; third, Triumph.

Essex M.C.

The executive of the above club has postponed the date of the annual 200 miles non-stop trial from July 4th to August 29th.

Leeds M.C.C.

The winner of the cup and gold medal in the Leeds-Edinburgh and back twenty-four hours run is F. W. Greenwood (3½ h.p. Rex). Gold medals: 2nd, G. E. Tennant (5 h.p. Vindec), lost 2 points; 3rd, Eric Myers (3½ h.p. Triumph), lost 58 points. The following finished in twenty-four hours, and will receive bronze medals: H. D. Shaw, E. Slater, A. H. Hyde, and J. Percival (all on 3½ h.p. Triumphs).

There will be three classes in the Sutton Bank hill-climb next week-end—singles (standards), singles (T.T. or specials), and twins. Final to be run off by the three winners; handicap for final to be made by the difference in time, the fastest to allow the others the difference in their class time. Entries will be taken on the spot.

Walthamstow M.C.

The above club was strongly represented at the Woodford meet on the 20th inst. The very tasteful appearance of the cars, tricars, and bicycles was very creditable to the members, and was greatly appreciated by the public all along the route. The first prize for decorated motor cars was received by the president of the club (Dr. Stanley Owen), and the prize for the best decorated motor cycle (with forecar) by R. J. Lisles. Another special typical representation was by the hon. sec., J. W. Percival, who, attired as a French army officer, carried a lady passenger in his tricar dressed as "Britannia," and displayed the familiar words "Entente Cordiale."

Southern M.C.

A 100 miles reliability trial and speed-judging contest was held on Saturday last for the Howlett challenge cup and gold medal.

Tricars and cars: This competition was decided over a circular course of thirty-three miles which was covered three times. The winner was judged by even running over the three circuits, making non-stop runs. The winner proved to be Mr. Harrison (9 h.p. Riley car). Two tricarists competed, viz., W. Portwine (5 h.p. A. and A.C.) and S. Goodley (4¼ h.p. Phœnix).

100 miles motor cycle reliability trial for gold medal and certificates over the same course at same time. Entries: T. E. Goodley (3½ h.p. Triumph), E. K. Davies (3 h.p. Davies), J. Wheeler (3½ h.p. Triumph), G. Connor (2¾ h.p. Twin Fairy), and G. Aldington (5 h.p. Twin Kerry). The winner of this event was J. Wheeler, and second T. E. Goodley.

Harry Martin rode a machine fitted with Continental tyres when he won the ten miles motor cycle handicap at the Stadium on Saturday, the 13th inst.

The latest form of Palmer Cord tyre is provided with a flap on the inner side to prevent the tube being nipped. Motor cyclists will be much interested to hear of this improvement, as it tends to add further to the excellence of the tyre mentioned above.

Inter-club meet of the Lincolnshire M.C.C. and Hull and East Riding A.C.C. at Scawby Gull Ponds last Saturday.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Motor Cycling in Southern Nigeria.

[3365.]—In your issue of May 6th you publish a letter from Mr. J. H. Greenup, in which he states that he is not aware of another motor cycle on the Coast.

I do not know whether Mr. Greenup is referring to the Gold Coast simply, or whether he means West Africa generally, which is known as the Coast. If he alludes to the latter, I beg to inform him that there are several motor cycles being ridden here in Lagos, including three or four Moto-sacoches and a twin-cylinder Fairy. W. A. WILLIAMS.

Lagos.

Petrol in One Gallon Tins.

[3366.]—*Re* letter 3363, "Petrol in Small Cans," I am sure there are hundreds of riders who are waiting for these to come along; they are needed, and badly needed, too. There are many garages who will not sell less than two gallons, and there are many riders, like myself, who have not capacity for that quantity, and we do not want to buy the tin every time. I have never had the experience of being served with paraffin up to date, but it is not too late with the present deplorable state of affairs. I rode to London last week, and having to call for petrol at Stamford I found the Pick Motor Co. most obliging. They will serve with half a gallon of Shell if needed. SHEFFIELD.

Front Wheel Stands.

[3367.]—*Re* front stand mentioned in *The Motor Cycle* by "Ixion," I have one on my machine which I made like an ordinary carrier. It clamps on the back stays with wing nuts; reversed, it makes a stand for testing; it is instantly detachable. I have two pedal bicycle rear axle steps screwed on front spindle, which fit the same wing nuts used at the back. The stand is simply taken from back, sprung on steps on front forks, wing nuts screwed on, and front wheel is immediately jacked up, and the necessary repairs can be done. The stand can then be replaced. With this class of carrier only one is required, as it answers the purpose of carrier and stand for either front or back wheel. I have had it on my machine for about four years, and have seen no stand on the market to equal it for convenience. Should anyone feel interested in it, I should be pleased to show it.

W. ANTROBUS.

Gudgeon Pin Fastenings.

[3368.]—Having read with great interest "Ixion's" remarks *re* gudgeon pin set screws falling out, I enclose for your inspection a snap-shot, which will, I think, serve to further substantiate his claims. The photograph, as you will no doubt be aware, is of a 3¼ h.p. 1905 Rex cylinder. A large piece has been knocked clean out of the front of it, also a corresponding piece out of the bottom of the piston. Strange to relate, the pieces of the cylinder and both set screws were found in the crank case, in the recess between the flywheel, whilst the fragments of the piston cannot be found anywhere in the engine, so I infer that they are somewhere on the road. The owner drove the machine home six miles after the smash without any harm resulting, bar, of course, the loss of a large quantity of oil. H. R.

Warning.

[3369.]—In *The Motor Cycle* of May 20th I noticed an advertisement in the "Tyres for Sale" column. I wrote and asked the advertiser to send them through, and I would send the money by return. I got a reply, stating if I sent 9s. 9d.—half purchase money—they would be sent off at once. I sent the 9s. 9d. by return, and I have not heard any more of either goods or money. I have since posted two letters to the same address, and had them returned, marked "Gone away." I write this to caution other readers from sending money on trust. J. N.

[Readers are recommended to adopt the deposit system when dealing with unknown advertisers.—ED.]

Motor Cycle Speedometers.

[3370.]—*Re* "W. H. C.'s" query. I have had in use for 600 miles a Simplex speedometer, Goodlad's patent, sold by Gamages, registering up to forty-two miles per hour. This was supplied with a clip not suitable for the 1908 Triumph front forks, so I returned it for a suitable one. The meter is driven by the front wheel rim. I notice "W. H. C." says this system is useless, but he is wrong, as mine has proved most satisfactory. The range up to forty-two miles per hour ought to be sufficient for anyone off a racing track.

CHARLES B. GRACE, A.M.I.E.E.

Sidecars.

[3371.]—I should like Mr. Montgomery to modify his insinuations against the medical profession. Until that happens I can but treat his letter [No. 3362] with contempt. A debator must have few points to impress when, in discussing general matters, he descends to pseudo personalities and the like. The aspect he has taken gives a different and unnecessary complexion to the subject.

It appears that he found a cap which would fit him, and wore it, but I am sorry he misreads my words in such a way as to let himself write as he does.

B. RICHARDSON BILLINGS.

[Personal recriminations must now cease. Any further personalities will not be published.—ED.]

Standard Machines in Competition.

[3372.]—We are very pleased to see that you have taken up the question of specially built machines being used in hill-climbs and other competitions, as it is obvious that a strongly built, fully equipped touring machine is heavily handicapped when competing against a machine with light tyres, and weight cut down in every direction.

We believe that we are almost the only firm who have been successful in competitions during the last few years, and who have never built a machine which has varied in the smallest detail from our standard specification.

We would welcome any scheme which would enable a responsible official to select a machine from stock for the makers to enter in a reliability trial, hill-climb, or speed test.

It has always been a matter of surprise to us that the customary rule with reference to standard machines has not been more rigidly enforced, as it is certainly unfair to the public to advertise performances which could not be accomplished on a fully-equipped standard touring machine of the same make. PHELON AND MOORE, LTD.

Soldering Petrol Tanks.

[3373.]—May I be allowed to state the *modus operandi* when *I* solder a petrol tank? I proceed as follows: First I drain off as much petrol as will run out of the tap. Then I *open* all the air holes, etc., and shake the tank well. This fills the tank with pure petrol vapour. Next step is to *close* all the air holes, and commence operations. I use a blow lamp, and the heat expands the gas in the tank, which burns at the hole to be mended, materially helping to melt the solder. EUCHLORINE.

A Smart Accessory.

[3374.]—In "Occasional Comments" "Ixion" describes, under the heading of "A Smart Accessory," a generator bracket just evolved by the Advance Co., which savours to some extent of an arrangement of my own, carried out and in use by me during the past two years. Some time ago I sent you a photograph and drawing of lamp bracket and generator clip, which I hoped you would have illustrated for the guidance of any riders preferring a different method for lamp and generator attachment from that usually in vogue.

I now send you a sample of my clip—an early pattern. The clips I have made since are much stronger, to obviate breaking through vibration (which happened once). I also devised a double holder for a generator on either side. The flat or lower plate is cut across with ends meeting under top tube, the entire affair being held firmly by the usual screws, and is as good as if solid. This enables the holders to be slipped into position without disturbing tank. It is rather difficult to understand from what "Ixion" says how a tongue bracket can be incorporated with the usual tank clip, seeing that the latter is merely a band and lugs of very light material, usually about $\frac{1}{16}$in. thick, and certainly not strong enough to be continued as a generator support.

My clip is suited for the Triumph machine, taking advantage of the narrow front end of the tank, thus enabling the generator to be kept close to the machine, and more secure from injury in case of a fall than when clipped to outside of front forks. I consider a clip that has no connection with the tank fittings preferable, as it can be removed at any time or adjusted to suit circumstances.

I think a front wheel stand is hardly necessary. Front tyre punctures, as "Ixion" says, are comparatively few, but if one does happen the easiest method is to lay the machine down on the grass by the roadside or against a bank. This leaves the front wheel free to be rotated for manipulating the tyre cover. Of course, this method would hardly apply to machines fitted with accumulator ignition, on account of the acid running out of the batteries, but with a magneto such an objection is non-existent. R. G. LINDSAY.

[What becomes of the petrol if tank is almost full, and what about scratching the paintwork of tank, bending levers, etc.?—ED.]

A Medico's Experience in our Colonies.

[3375.]—I believe it will be of some benefit to colonial readers, as well as to manufacturers in England, to read this letter of mine *re* motor cycling in a colony.

I bought one of the very best machines on the market, and it cost me, landed here, together with a few spare parts, about £70. I have up to now ridden on it 205 miles, and the following are the conclusions I have come to: (*a*) The engine and magneto are perfect; (*b*) the two-speed gear is good; (*c*) the frame and wheels are bad; (*d*) the screws, nuts, pedals, and accessories are rotten.

I must first say that my machine was bought from a firm who specialise in a double gear on the epicyclic principle. They procure an engine of a first-class make, and fix it with their gear and the magneto to a frame of some kind without looking at all at particulars. Evidently, the machine is meant only for home use, but if the frame and parts were better it would go splendidly in the colonies.

To give you an idea of how carelessly things are done at home, I received the machine badly packed, there being a big dent in one of the tanks. The makers who sent it direct to my agent forgot to fit a sparking plug, sent a footrest to be fixed with a broken lock nut collar, and a lubricating oil tap without a pin to limit the movements of the plunger.

I started the machine by making a new lock nut collar for the footrest and using a spare sparking plug. Everything went all right on the flat, but as soon as I started on the hills the pedal of the low gear began to bend. It bent so much that I had to give it to a local blacksmith to straighten and to rebraze it. By fixing a wire between the low gear pedal and the brake pedal I partly overcame the difficulty.

Two or three days afterwards the tap of the lubricating tank, which had been sent without the pin, turned inwardly, and all the oil ran into the engine. The engine smoked for about half an hour without me knowing the cause of it, and it thereby overcame that difficulty.

Next day I noticed all the screws of the low gear were loose, and there was no way of fixing them, because if tightened they would not allow the free play of the gear. One nut even got lost. I replaced the lost nut with a spare, and with some tinkering I fixed the screws in such a way that they will not get away all together. Nevertheless, the moving of the screws is bound to wear out the threads.

The following day the handles came off, one spoke of the back wheel broke, and the steering fork began to move. I put the handles in my pocket and left the spoke to itself, hoping to replace it. The moving of the steering fork is beyond remedy, because the screw at the top which fixes the cones is too big and the thread is partly worn. I fixed it in some way, but the vibration has already damaged the inferior cone of the steering fork.

Next day when the boy was cleaning the motor cycle the oil tap turned inward again, and all the lubricating oil ran into the engine. Starting of engine was impossible.

Arthur W. Bentley, the Land's End to John-o'-Groat's record holder on his 3½ h.p. Triumph motor bicycle, at John-o'-Groat's House Hotel.

After much tinkering and speculating I recognised the fault by finding the oil tank (which I had filled the day before) empty. Of course, everybody would tell me it is very easy to get the oil out by opening the tap underneath the engine. Yes, theoretically, it is all right; but practically, it is all wrong. As I said before, the engine is a splendid one, but the frame is bad, and the engine was not meant for the frame. In order to make it possible to use a good engine the makers did not trouble about the oil tap, and they fixed it against the frame in such a way that it cannot be moved unless one breaks the tap or the frame. At last, after vainly trying to burn the oil, and exhausting all available muscular strength of myself and three of my servants by turning the starting handle, I hit upon the good idea of unscrewing the nut of the oil tube; then, by again turning, pushing, and tugging at the handle I got the engine to spit out the excess of oil; it was then an easy matter to burn the rest.

Next day the gear case for the magneto transmission broke. Now I wonder what will come next, because I cannot say I have given a thorough trial to the machine, having only ridden 205 miles.

The engine, of course, will not give any trouble, and the gear little, but all the rest—frame, wheels, pedals, operating brake and gears, nuts and screws, etc.—will all give trouble sooner or later.

Of course, I never mentioned that a hand brake is continually out of action, that the belt went into bits after 150 miles, that the double coil horn does not give any sound when

it is necessary to use it, that the cyclometer was not a proper fit, that the carrier could not in any way be attached to the machine, that a nut fixing the silencer was too loose and got lost, because I am informed that these are faults partly independent from the makers, and that every machine is liable to them (!)

Now may I be allowed to ask, Is it right for a manufacturer when sending a first-class machine 6,000 miles away, to be used on rough country, with uneven roads, to be ridden over sand and over stones, over breakneck hills and over marshes, to be pushed, swum, or carried over spruits, torrents, or rivers—is it right for him to be so careless? How long would it take him to see if the nuts fit tightly, if the screws have good threads, if the spokes are sound, if the handles are good, if the pedals are strong, if the taps can be opened, if there is anything on the machine which he has forgotten, or which is broken? Why does he not think for a moment that we colonials at such enormous distances from home cannot get these things replaced, and that we do not mind a few pounds more or less so long as we get something good, something reliable, something which does not need tinkering at? Let us hope he feels some remorse if some accident happens as the result of his laziness and carelessness

A. BONFA, M.D.

Umzinto, Natal.

Carnmoney Hill-climb.

[3376.]—"Wellwisher's" letter in your issue of the 10th inst. might have caused him to be credited with what his *nom de plume* claims had he been frank enough to sign his real name. As it is, I can only give him credit for being not devoid of humour, though he writes more in a facetious vein.

Carnmoney Hill, if not equal, say, to Ballybannon, was at least sufficiently long and steep to make a difference of time amounting to minutes in the lower powered cars.

I hold no brief for motor cycle competitors or the M.C.U.I., so I pass his criticisms without comment. My only interest in his correspondence lies in his reference to the winning car—a 14-16 h.p. Argyll—which I entered and drove in the above competition. For his complimentary remark I thank him, at the same time wishing to rectify his incorrect suggestion *re* special gear box. The gears, as indeed all other parts of the car in question, including engine, were, and are, standard, and this can be proved quite easily.

"Wellwisher" might very well wish to learn that it is correctly-designed, carefully-built engines, developing power up to their maximum, that provide speed (with proper transmission, of course) for hill-climbing, not "special gear boxes."

H. T. FERGUSON.

Wanted, Eisemann Magneto Hints.

[3377.]—I have been a reader of your most interesting journal for some time, and I have noticed particularly one thing. Every other week almost we have something or other about every make of magneto, except the one I have myself—the Eisemann. My machine is a 3½ h.p. N.S.U., and my magneto has given me the greatest satisfaction since I got my machine last summer. We have simply awful roads in this part of Ireland (Ballinasloe), and my N.S.U. went perfectly the other day through nearly thirty miles of mud without a front mudguard to protect it. The agents from whom I got the machine put in ordinary stays to my spring front forks, taking away, of course, all "spring" out of them, and I had to take off the whole front mudguard while negotiating the proper one. Nevertheless, although buried in mud and slush, my Eisemann fired perfectly.

I wrote trying to get a book on it, but could not, and the only book the N.S.U. people had, described a magneto that had two carbon brushes, etc., evidently not my type (1907). I am always reading tips about other magnetos, but never can see anything about the Eisemann. Will someone please tell me how to flush out bearings with paraffin? Or should this be done as I see so often recommended for the Bosch magneto? Any information will indeed be gladly received.

Here, miles away from even a botchy repairer, many and wonderful have been my experiences as a beginner forced to find out everything for himself. I so enjoy your articles on novices' adventures, having had so many little trials myself. Once (please do not turn away in scorn, oh ye old hands!) I rode for three days on a badly punctured steel-studded Peter Union back tyre (extra thick, as I weigh 15½ stones), blaming my spring forks, the roads, etc., everything but the right thing. And at last it burst on me what was wrong on going over a large stone and getting a large dent in my belt rim, jamming it down on the belt. On another occasion, riding a three year old machine in learning, after finding out *ad nauseam* how to stop every way but with the regular levers, I was brought to an ignominious stop on a hill entering a town. Soon surrounded by an interested crowd, who intently watched my perspiring efforts, I was oracularly informed by an "engineer" present, who ran the oil engine at the local water works, that he thought she wanted "ile." I found at length that a brass tube in the inlet pipe had shifted internally, and when the lever showed "full on" for the mixture, in reality it was "full off"!

CONNACHTMAN.

["Motor Cycles and How to Manage Them" contains a detailed description of the Eisemann magneto for motor cycles.—ED.]

EXPERIENCES WANTED.

"Tourist" would like readers' experiences of hotels in the Lake District and Southern Scotland where motor cyclists are welcomed.

T. S. L., Homerton, would like users' experiences with the Nala two-speed hub. He has one fitted to a sidecar, and would like to see how readers' experiences compare with his own.

Will the makers of the front wheel stand who sent two prints showing it fitted to the front wheel of a motor bicycle provided with spring forks kindly communicate with the Editor, as their address has unfortunately been mislaid?

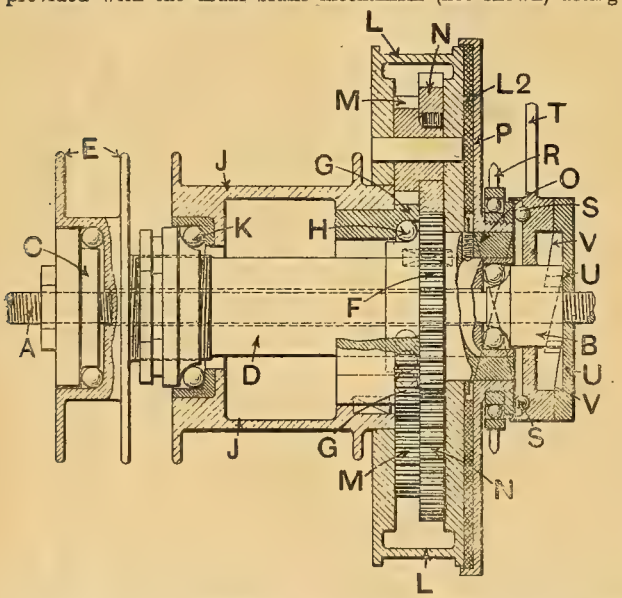
The New York Motor Cycle Club held a successful competition on Fort George Hill early this month. A. G. Chapple (6 h.p. N.S.U.) on the left won his class. In the right hand photograph are Mr. Hendee, the maker of Indian motor cycles, and Mr. Hedstrom, the designer. This make of machine won four classes.

RECENT PATENTS

By ERIC W. WALFORD, F.C.I.P.A.

A Two-speed Gear Hub.

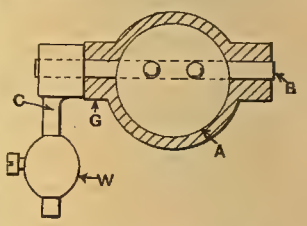
MR. A. D. POWELL, of Burgess Engineering Works, Leicester, has developed this invention with the object of providing a substantial construction which will require but little alteration to existing cycles, will provide a two-speed pedalling gear, will enable the pedals to drive the engine only (if necessary), and will support the driving belt pulley in a more substantial manner than usual. The fixed spindle A is mounted in the fork ends, and a cone B and C is arranged at each end. On ball races on these cones is mounted a cylinder D, with—at, say, the left-hand end—flanges E, suitably spaced, to which are attached the spokes supporting the belt pulley or the like. Although the belt pulley is mounted at one end of the hub, the bearings B and C for the same are at both sides, and a suitable support is thus provided. Keyed upon this cylinder is the driving pinion F of the gear, and the driven pinion G is mounted upon a ball bearing H on the driving pinion F. The driven pinion is attached to the hub shell J, and consequently the hub shell is supported on this side by its ball bearing H. At the opposite side the hub shell is mounted upon a ball bearing K running upon a cone adjustable on the cylinder D. The drum L carrying the intermediate pinions M and N is mounted upon bearings upon the driving pinion and the hub shell, and it is provided with the usual brake mechanism (not shown) acting

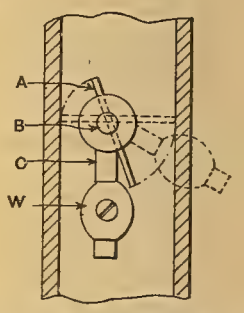


on its periphery for holding it stationary, whilst one face L^2 is formed as a clutch face. The driving pinion is extended as at O, and it is squared or provided with key-ways, upon which is mounted the movable clutch member P. On this movable clutch member P is carried the pedalling free-wheel clutch R, and against one face is mounted a thrust ball bearing S, which lies between that face and a movable clutch actuating member T. This movable member T may co-operate with a fixed member U, each having inclined faces V, or cams, so that when the movable member T is rotated slightly in relation to the fixed member U, which is fixed to the spindle, the cam faces ride over one another and impart a lateral thrust to the movable clutch member P. A solid gear is obtained by actuating the clutch P L^2, and a reduction, according to the gear ratios, is obtained by freeing the clutch and holding the drum L stationary by means of the brake band. By leaving the clutch out and the band brake disengaged, the pedalling gear can operate the belt pulley, and consequently the engine, without driving the hub shell. In this way the engine can be started without moving the machine. Again, the pedalling gear can operate the hub shell through the two-speed gear, as will be clearly seen. It will be seen that the belt pulley is supported in a very substantial manner, and that the hub shell is arranged practically centrally, necessitating slight alteration in fitting to existing machines.

A Simple Governor suitable for Tricars.

IN this invention, which has been protected by Mr. R. Howard, of Gonvena, Wadebridge, the flow of the mixture is caused to act upon an unequally pivoted and adjustably counterweighted throttle plate. The plate A corresponding to the section of the pipe to which it is adapted, is attached to the spindle B in such a way that the area of one portion of the plate is greater than the area of the other portion, the portions being divided by spindle B. The spindle B is made so that it can rotate in the pipe in which it is fixed at right angles to the flow of gas, and is extended outside the pipe through a gland G, and on the extension of the spindle B is fixed, at an angle of about twenty-five degrees with the plate, an arm C upon which is mounted on a movable and adjustable weight W, the arm C and weight being thus outside the pipe and the plate inside. The weight W is movable along the arm C so as to increase or decrease its distance from the spindle A, and so as to increase or decrease its leverage upon said spindle. The action of the governor when applied to the intake pipe of a petrol engine is as follows: When the arm C with weight is not held up by hand, or other mechanical means, it falls by gravity to its lowest position moving the plate inside the tube in such a position that the explosive mixture can pass without hindrance, and the engine may thus get an impulse for two or three strokes. As the engine increases in speed the velocity of the mixture passing through the pipe increases also, and causes an upward pressure on the underside of the larger portion of the plate A When the pressure reaches a predetermined point it causes the spindle to rotate, carrying with it the arm and weight. The plate now blocks the passage (see dotted line) of the mixture to the engine, and the engine decreases in speed. As the speed drops so does the suction causing the flow of gas or mixture, and the weight overcomes the pressure on the under surface of the plate, causing the spindle to again rotate and free the passage for the gas through the pipe. The engine again receives a few impulses and the action is repeated. When it is not required to govern or regulate the engine this arm can be held up by mechanical means, operated by the driver of the engine or the tricar to which it is adapted.





We know of a very good man in the motor cycle industry who will shortly be disengaged. He would be an acquisition to any firm who wished to extend their business in the West of England. Letters should be addressed West of England, care the Editor, *The Motor Cycle*.

LONDON TO EDINBURGH.

The most remarkable and unequalled results

are scored by

"Shamrock-Excelsior Tyres."

"Shamrock-Gloria Belts."

Read what successful Competitors say:

Mr. I. B. H. Davies:
"I used the S.G. belt throughout the run. It has not stretched at all, although my weight is fourteen stones. The belt appears to me to absorb less power in passing round the pulley than any of my former belts, with a noticeable absence of cracks on the top side."

Mr. J. Winslow:
"I had a splendid run from Edinburgh and return. I used your S.E. tyre on back wheel, and did not touch it all the way through. It has now done over 1,500 miles, and is in good condition. The same S.G. belt carried me through both ways, and is still good."

Mr. P. Janson:
"I am pleased to inform you of the splendid manner in which your belt and tyres carried me through the run. No doubt they had a great deal to do with my success in obtaining a gold medal, as I had no trouble or punctures whatever from start to finish."

S. G. Belts were also used by: Mr. W. H. Wells, Mr. A. G. Reynolds, Mr. S. G. Frost, Mr. E. Gwynne, etc., etc.

Mr. A. J. Sproston:
"S.G. belt on my Vindec Special stood splendidly, going through without attention of any kind. In spite of harsh treatment while returning it completed the 1,100 miles without giving slightest cause for complaint."

Mr. O. C. Godfrey:
"The S.E. tyres fitted to my Twin Rex gave absolute satisfaction throughout the whole of the journey. I must really compliment you upon making such a fine tyre. For the S.G. belt also I have nothing but praise."

Mr. W. A. Sale:
"The S.G. belt for the L.-E. run gave perfectly satisfactory results. I used the same belt riding home. It was only a ⅞in. belt on a 5 h.p. Vindec twin, and it still looks like new. One cannot expect anything better."

Mr. H. G. Cove.
"Very pleased with Shamrock Excelsior tyre."

Mr. W. Chater Lea:
"The S.E. tyres were used on a Chater-Lea carette, and were very satisfactory."

Mr. J. S. Harwood:
"Your S.G. belt and rubber-studded tyres gave perfect satisfaction, and required no attention from start to finish. This is the first occasion on which I have gone through a twenty-four hours' event without tyre trouble."

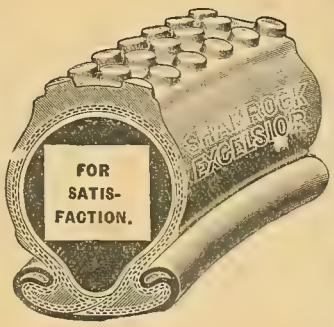
Mr. Chas. J. Seed:
"I had the good fortune to use one of your belts, and had not the slightest trouble with it."

Mr. William Pratt:
"The S.E. tyre went through the whole journey without a single puncture. On greasy roads and wet tramlines I could not detect the slightest sign of sideslip."

50% used S. G. Belts.
(The remainder divided amongst 5 different other makes.)

33⅓% used S. E. Tyres.
(The remaining honours divided amongst 10 tyre manufacturers.)

Sole Manufacturers:
THE HANOVER RUBBER Co.,
29-31, Old Street, London, E.C.



MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All adver isements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

HALIFAX.—Twin-cylinder Onaway, spray, specially low, suit short rider; £22 10s.; spring forks.

HALIFAX.—4 h.p. Alcyon, fine 26 by 2½ tyres, twin, spring forks, N.S.U., two-speed gear, light and low; £23 10s.

HALIFAX.—Twin-cylinder magneto Vindec Special, condition exceptional; cheap, £35; spring forks.

HALIFAX.—2¾ h.p. Phelon and Moore, two-speeds, 26 wheels, carry heavyweight; £27 10s.; any trial.

HALIFAX.—Twin-cylinder Hadley, 4½ h.p., Calmon and Clinchers, 26 wheels, special finish; £17 10s.

HALIFAX.—6 h.p. twin Antoine, 26 by 2¼ tyres, R.O.M. ignition, guaranteed running order; £22.

HALIFAX.—Lightweights, in going order, 25s. deposit and six monthly payments of 22s. 6d. secures 2 h.p. Quadrant, 1¾ h.p. Minerva, 2 h.p. Minerva, 2 h.p. Kelecom, 2 h.p. Quadrant, 2 h.p. Humber, 2 h.p. Universal, and 2 h.p. Princeps—Address below.

HALIFAX.—45s. deposit and six monthly payments of 29s. 6d. secures 2¾ h.p. Excelsior, 3 h.p. Humber, 2¾ h.p. Minerva, 2¾ h.p. De Dion, 2¾ h.p. Hobart, 3 h.p. Lloyds, 2¾ h.p. Minerva, 3¼ h.p. Rex, 2½ h.p. Aurora, 2¾ h.p. Kerry, 3 h.p. M.M.C.; all guaranteed running order.

HALIFAX Motor Exchange.—Cash, exchange, or extended payments. High-grade machines purchased for spot cash.—16, Westgate, Halifax. Telephone, 766. Telegrams, Perfection.

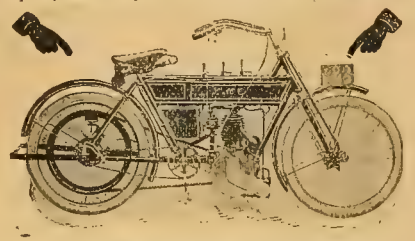
NEW MOTOR CYCLES FOR OLD.

This is not a new business with us, but one which we have always carefully studied—and have always recognised the advantages accruing to motorists to be able to get rid of the old machine without the trouble of advertising and interviewing, which often results in failure. Remember, your machine is never sent to us on a fruitless journey. We guarantee to either take it in part exchange, buy it outright, or sell it on commission on a no sale no commission basis. We supply all leading makes and always have a good selection on show. Send particulars of the machine you require, and send your old machine to us for valuation.



Winner of the Birmingham Hill Climb. Price complete with Magneto 45 guineas. Free engine £3 3 extra.

SECOND-HAND MACHINES.

We have always a stock of second-hand machines that we can recommend to offer. Write or call.

Prices from £5 10 0.

ACCESSORIES.

We are anxious to meet all requirements. Clutches, 2-speeds, gears, and many other interesting specialities on show. It will pay you to call, and if our experience in motors generally will be of any service to you, we shall be pleased to help you.

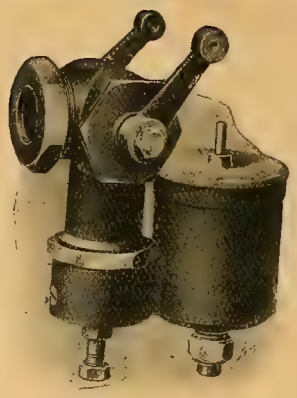
THOMAS CLAYTON & SON, LTD.,

Showrooms—126, New Street

(Next to the Midland Hotel),

BIRMINGHAM.



A New Carburetter.

Some of its Special Features:

Efficiency, Lightness, Strength and Durability.

Float Chamber and Spray Chamber are made of Castings. The Fitting of the adapter has been very much improved. It is now held firmly in position by means of a Coil Spring. To clean the Jet it is only necessary to undo one Nut, the Joint being rendered Petrol tight by means of a Fibre Washer. The construction of the Throttle and extra Air Inlet is very strong, and it is impossible for any play to take place in either. This type of Carburetter has been introduced for those who require a stronger type of Carburetter than that previously sold by us, but the smaller lightweight pattern will still continue to be manufactured, its efficiency having been well proved on Engines up to 3½-4 h.p.

MODELS CAN BE SEEN IN

2½/3 h.p. "Fairy" (Magneto Ignition).

What a Colonial Rider thinks of THE FAIRY.

Grahamstown, South Africa, 3/2/08.

"It may interest you to know what satisfaction the Fairy Motor (2½ h.p.) is giving me out here.

The roads are very bad as compared with English ones, and on average of 15 miles an hour is the utmost a large 17 h.p. car can run.

The little Fairy climbs the hills about here with ease, some parts of which are 1 in 5 or 6. This may seem steep, but is a fact. She only needs a touch of the pedals to help her out."

FURTHER PARTICULARS CAN BE HAD ON APPLICATION TO

THE FAIRY MOTOR CO.,

A NECESSITY When on Tour.

The Autocar FOLDING MAP for Motorists

(In Strong Case).

When on tour the automobilist is often faced with the question or which road to take or the best way to reach a certain place. All such difficulties can be overcome by carrying "The Autocar" Folding Map in your kit. It occupies very little space, as when folded it measures only 7½in. × 9½in. All main roads are marked in red, and the distances between all important towns are given.

PRICE 8/10, Carriage Paid.

Please mention that the folding map is required when ordering.

The Offices of "The Motor Cycle," 20 Tudor Street, London, E.C.

3½ h.p. Accumulator Model, £50 - 0 - 0

If you have a two speed geared Machine other than the P. & M. you will have noticed how difficult it is to prevent the engine roaring when running free. One of the many unique features which go to make the P. & M. such a perfect Machine is the Half Compression device which automatically comes into action when the ignition is retarded, and enables the engine to throb quietly with the gear lever in the neutral position.

FURTHER SUCCESSES OF

The BROWN MOTOR BICYCLE

Thursday, 5th May, in the Welsh A.C. Motor Cycle Hill Climb at Carmarthen, Mr. B. Trevor Davies, on a 3½ h.p. "BROWN" Motor Bicycle, did FASTEST TIME OF THE DAY.

Monday, 8th May, in the Lincolnshire M.C.C. Reliability Trial (about 126 miles), Mr. E. R. Cole (Sleaford), and Mr. R. N. Morley (Leadenham), on Single Cylinder "BROWN" Motor Bicycles, secured NON-STOP AWARDS.

Saturday, 30th May, in the Coventry Motor Club run from Coventry to Holyhead, Mr. R. G. Thomas, on his 3½ h.p. "BROWN," was awarded a certificate for NON-STOP RUN.

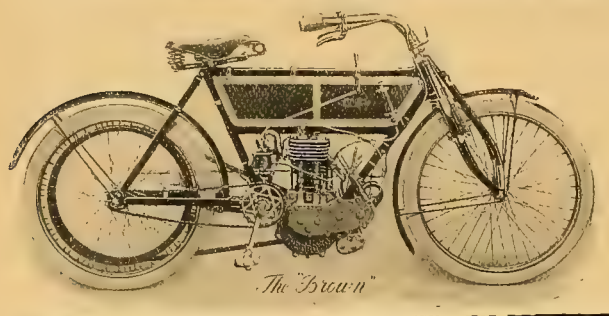
Saturday, 16th May, in the Liverpool M.C.C. Hill Blimb, Mr. H. Brookes, on a "BROWN" Motor Bicycle, secured SECOND PLACE.

Saturday, 16th May, in the Western District Motor Club Reliability Run from Hounslow to Bath, a distance of 188 miles, Mr. H. Kirk, on a "BROWN" Motor Bicycle secured SECOND PLACE.

In the M.C.C. Hill Climb at Sharpenhoe on Saturday, May 2nd, the "BROWN" Motor Bicycle did FASTEST TIME in the Single Cylinder Class, WON the Single Cylinder Handicap, and did FASTEST TIME OF THE DAY with the exception of one TWIN Cylinder. The "BROWN," however, beat thirteen Twin Cylinder Machines.

In the Essex M.C.C. Open Hill Climb at High Beech, on Saturday, 16th May, the "BROWN" Motor Bicycle secured THREE FIRSTS and TWO SECONDS OUT OF FIVE EVENTS.

In the Auto-Cycle Union's Open Hill Climb at Sutton Bank, the "BROWN" Motor Bicycle secured a FIRST and SECOND OUT OF TWO EVENTS.



Could there be stronger evidence of the sure merit of "BROWN" motor bicycles than the above? Don't you think it would be to your interest to have all particulars of the "BROWN" before deciing on your choice of a machine? We are certain it would. Write us now for the "Book of the 'BROWN' Motor Bicycle."

The Difference

between the light given by

"Autoclipse"

REGISTERED TRADE MARK

MOTOR CYCLE LAMPS (above) and ordinary motor cycle lamps (below) means the difference between safety and danger.

MR. W. H. WELLS, the well-known motor cyclist, says of "AUTOCLIPSE" Lamps—"Although near-sighted, I can see the road perfectly for 100 yards ahead." The long distance rays of "AUTOCLIPSE" Lamps means safety—practically an insurance—as any obstacle can be seen far enough in advance to enable the rider to "slow up." These long distance rays can, however, be entirely eliminated when passing through towns or traffic by means of the Patent Self-Eclipsing mechanism, leaving only the diffused light, which is quite sufficient for immediate surroundings, the full illuminating power being immediately resumed whenever desired.

With Eclipse Mechanism, brass 30/-, plated 35/-.
Without Eclipse Mechanism, brass 24/-, plated 27/-.

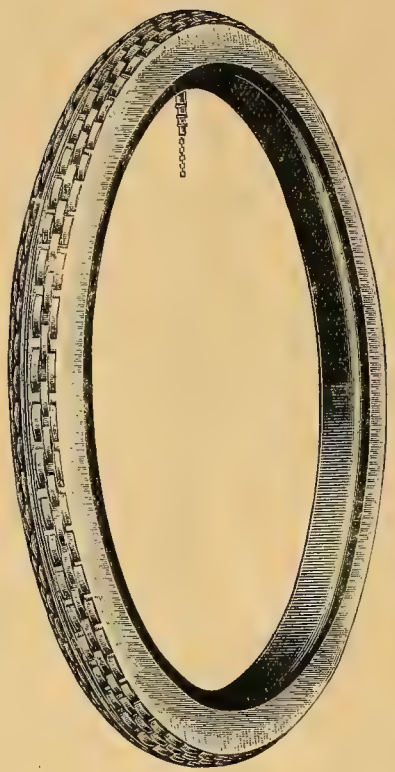
Peter

There's quite a lot of difference between the PETER UNION tyre and the kind that always lets you down when you are in the middle of nowhere on a wet night.



The PETER UNION tyre is prominent wherever conditions call for exceptional tyre durability. Evidence of this is seen in any touring test or race meet. Follow the example set by the men "in the know."

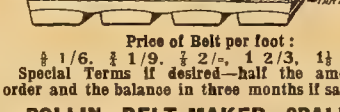
ASTON ROAD, BIRMINGHAM.

MOTOR RUNS FASTER.

40, Jubilee Road, Doncaster, May 12th, 1908.

Dear Sir,—I am very pleased to inform you that the sample Centipede ⅞in. belt you sent me gives every satisfaction. It is the best belt I ever used, and I'm no chicken in motor matters. It "grips" and is beautifully clean, practically free from stretch, very flexible, and my machine runs faster with it than ever before. Trusting you may have the success you deserve,

Yours faithfully, J. H. Wilkinson.



Price of Belt per foot:
⅝ 1/6. ¾ 1/9. ⅞ 2/-, 1 2/3, 1¼ 2/6.
Special Terms if desired—half the amount with order and the balance in three months if satisfactory.

POLLIN, BELT MAKER, SPALDING.

Genuine Birmingham
"QUADRANTS."

DEFIANCE MOTOR CYCLES.

ADVERTISERS' EXPERIENCES OF "THE MOTOR CYCLE."

SPEAKS FOR ITSELF.

Rembrandt Studio,
Crawley,
Feb. 18th, 1908.

To "The Motor Cycle."

Dear Sirs,

It may interest you to know that of the two articles advertised in this last week's "Motor Cycle," one was sold by wire on the day of issue and the other by first post the following morning.

Altogether I received one wire, three cheques, and twenty-two applications.

This result I think speaks for itself.

Yours faithfully,
J. T. BELCHAMBER.

When buying a new machine or accessories, readers should remember that "The Motor Cycle" will speedily find a purchaser of the second-hand ones.

MISCELLANEOUS.

STRONG Carrier-stand, 5s.; spring seat-pillar, 3s., or exchange same for variable pulley for 2½ h.p. Kerry; letters only.—1, Borrett Road, Manor Place, London, S.E.

"3,500 miles and doesn't need grinding" is what a doctor says of the Druid exhaust valve; price 4s. 6d.; send old valve as pattern.—A. Drew, Conybere Street, Birmingham.

CHATER-LEA No. 6 Frame, girder forks, and long handle-bars, £3 17s. 6d.; 6 h.p. twin engine, £8 15s.; torpedo tank, 8s. 9d.; all brand new.—313, Coldharbour Lane, S.W.

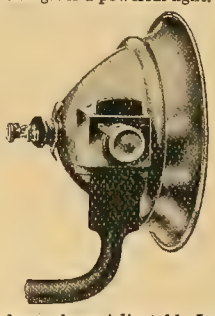
YOU MUST HAVE ONE

of our "Glare" Motor Cycle Head Lamps. Price only **10/6**. Several riders used them in the London to Edinburgh run and were perfectly satisfied, having had notrouble and getting a splendid light, uses only ½ amp. and throws a powerful beam ahead. Better than acetylene and far less trouble. Can be used off ignition cell with safety. We make a special Accumulator and box for use on machines fitted with Magneto Ignition. Price complete only **21**. Below is an illustration of our "Glare" Side Lamp for Cars and Tricars. Priee, only **16/-**, fitted complete with switch and lamp, only takes ½ amp. 4 volts., like our "Glare" Headlight, and gives a powerful light.

Price only **16/-**



Price only **16/-**

Have you tried one of our Adjustable Lamp Brackets yet? the price is only **4/6**. We are still making our original VARIABLE SPEED PULLEYS.

LOMAX TYRE COMPANY, Great Charles Street, BIRMINGHAM.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

Only one.

ONLY ONE four-cylinder F.N. was necessary in the recent London-Edinburgh classical run to demonstrate the wonderful reliability and advantages of this four-cylinder example. All eyes, of course, were centred on this one model, and the rider made an exceptionally fine performance, qualifying for the gold medal, and was one of the handful who decided to return to London on his machine.

Unless you have carefully studied the four-cylinder principle, you cannot appreciate the advantages its simplicity offers over other single or multiple-cylinder machines.

The explosions are less in volume, with consequent silence, the running is sweeter; whilst the fact that belt troubles are entirely obviated, through the bevel gear transmission, renders a run on the four-cylinder F.N. the most delightful experience motor cycling offers. We shall be pleased to answer any question, little or big, you wish to learn.
